STATE BUILDING CODE TECHNICAL REVIEW BOARD MEETING MINUTES March 19, 2021 Virtual Meeting

https://vadhcd.adobeconnect.com/lbbca/

Members Present

Mr. James R. Dawson, Chairman

Members Absent

1

State Building Code Technical Review Board March 19, 2021 Minutes - Page 2

32 33 34		The motion was seconded by Mr. Witt and passed with Mr. Givens abstaining.
35 36 37 38 39 40	Public Comment	Chair Dawson opened the meeting for public comment. Mr. Luter advised that no one had contacted him to speak. With no one requesting to speak, requesting to be acknowledged to speak by use of the raised hand feature of the Adobe Connect meeting platform, or requesting to speak in the chat box section of the Adobe Connect meeting platform, Chair Dawson closed the public comment period.
42 43	Final Orders	Appeal of Sidney Harris; Appeal No. 20-02:
43 44 45 46 47 48 40		After review and consideration of the final order presented in the Review Board members' agenda package, Mr. Payne moved to approve the final order as presented in the agenda package. The motion was seconded by Ms. Monday and passed with Messrs. Pharr and Hutchins abstaining.
49 50		Appeal of Monica and Michael Davis; Appeal No. 20-03:
51 52 53 54 55 56 57 58 59 60		After review and consideration of the final order presented in the Review Board members' agenda package, Mr. Payne moved to approve the final order with the suggested editorial change to delete "d" for the word "required", creating the word "require", in line 100 on page 37 and remove the word "do" and replace it with the word "may" in line 157 of page 43 of the agenda package. The motion was seconded by Ms. Jackson and passed with Messrs. Pharr, Givens, Hutchins, and Mays abstaining.
61 62		Appeal of Patrick and Jean Sartori; Appeal No. 20-04:
62 63 64 65 66 67 68 69 70		After review and consideration of the final order presented in the Review Board members' agenda package, Mr. Mays moved to approve the final order with the suggested editorial change to delete the letters "ed" in the word "underlined" and replace it with the letters "ing", creating the word "underlining", in line 28 on page 47 of the agenda package. The motion was seconded by Ms. Jackson and passed with Messrs. Pharr, Hutchins, and Witt abstaining.
70 71 72	New Business	Fairfax County; Appeal No. 21-01:
72 73 74 75 76		A hearing convened with Chair Dawson serving as the presiding officer. The hearing was related to buildings located at 6231 Nelway Drive in McLean, Virginia which is in Fairfax County.
70 77 78		The following persons were sworn in and given an opportunity to present testimony:

79	
80	Ricky Salinas, Freedom Plumbers Corporation
81	Manuel Felipe, Fairfax County Code Investigator
82	Richard Grace, Fairfax County Code Specialist III
83	James Canter, Fairfax County Chief of Land Develop, Services
84	
85	Also present was:
86	And present was.
87	Paul Emerick legal counsel for Fairfax County
88	I auf Emeriek, legar counsel for I antax County
80	After testimony concluded Chair Dawson closed the hearing and stated
90	a decision from the Review Board members would be forthcoming and
90 01	the deliberations would be conducted in open cossion. It was further
91 02	noted that a final order reflecting the decision would be considered at a
92	noted that a final order reflecting the decision would be considered at a
93	subsequent meeting and, when approved, would be distributed to the
94	parties, and would contain a statement of further right of appeal.
95	
96	Decision: Fairfax County; Appeal No. 21-01:
97	
98	Motion #1
99	After deliberations, Mr. Mays moved to overturn the local appeals
100	board and uphold the local building official on the failed video
101	submission which was based on bullet item #5 of the modification
102	approval letter dated October 9, 2020 by the local building official
103	under the 2015 VCC. The motion was seconded by Mr. Kessler.
104	
105	After additional deliberations, Mr. Kessler moved to substitute for the
106	pending motion the following: To overturn the decision of the local
107	appeals board that a violation of the October 9, 2020 code modification
108	issued under the VRC 2015 regarding insufficient slope of the pipe
109	does exist. The substitute was seconded by Mr. Mays. The motion to
110	substitute was passed. The motion failed with Messrs. Givens, Kessler,
111	Mays, and Payne and Ms. Jackson voting in favor of approval.
112	
113	Motion #2
114	After further deliberations, Mr. Witt moved to remand the matter back
115	to the local appeals board for a re-hearing on the matter to clarify the
116	appropriate codes for which the modification request should have been
117	issued under, evaluate the matter under that identified code edition, and
118	clarify the decision being made. The motion was seconded by Ms.
119	Jackson. After further deliberation the motion and second were
120	withdrawn.
121	
122	Motion #3
123	After additional deliberations Mr. Witt moved to unhold the decision
120	of the local appeals board The motion was seconded by Mr Rutler
125	The motion failed with Chair Dawson casting the deciding vote in

VIRGINIA:	

1	VIRGINIA:
2 3 4	BEFORE THE STATE BUILDING CODE TECHNICAL REVIEW BOARD
5 6 7	IN RE: Appeal of Fairfax County Appeal No. 21-01
8 9	DECISION OF THE REVIEW BOARD
10 11 12	I. <u>Procedural Background</u>
13	The State Building Code Technical Review Board (Review Board) is a Governor-
14	appointed board established to rule on disputes arising from application of regulations of the
15	Department of Housing and Community Development. See §§ 36-108 and 36-114 of the Code of
16	Virginia. The Review Board's proceedings are governed by the Virginia Administrative Process
17	Act (§ 2.2-4000 et seq. of the Code of Virginia).
18	II. <u>Case History</u>
19	On September 29, 2020, Freedom Plumbers Corporation (Freedom) filed a code
20	modification request to the Fairfax County Department of Code Compliance (County), the agency
21	responsible for the enforcement of Part 1 of the 2015 Virginia Uniform Statewide Building Code
22	(Virginia Construction Code or VCC), for the home, located at 6231 Nelway Drive, McLean,
23	Virginia in Fairfax County. The modification request was for VCC Sections P3002.1 (Piping
24	within a building), P3002.2 (Building sewer), and P3002.3 (Fittings) which require drain, waste,
25	vent, and sewer piping and fittings to comply with the materials and reference standards listed in
26	VCC Tables P3002.1(1), P3002.1(2), and P3002.3 for the installation of Cured in place pipe
27	(CIPP) in 95' of sewer piping. In October of 2020, the County approved the modification request
28	contingent on eleven (11) conditions. A short time later in October of 2020, Freedom submitted
29	the pre-lining video pursuant to the County contingency listed in the modification approval letter.
30	The pre-lining video was failed by the County due to the pipe holding water.

19

Freedom filed a timely appeal to the Fairfax County Board of Building Code Appeals (local
appeals board). The local appeals board approved the appeal for the installation of the CIPP on in
December of 2020.

34 On January 4, 2021, the County further appealed to the Review Board. A virtual Review 35 Board hearing was held March 19, 2021. Appearing for Fairfax County were Richard Grace, 36 James Canter, Manuel Felipe, and Paul Emerick, legal counsel. Ricky Salinas attended on behalf 37 of Freedom. The property owner, Leonard Leo, was properly notified but did not attend the 38 hearing.

39

Findings of the Review Board

40 Whether to uphold the decision of the local appeals board and overturn the County that the
 41 conditions of the modification granted by the County, under the 2015 VCC, were met
 42 regarding pipe slope.

The County, through legal counsel, argued that the decision of the local appeals board was not influenced by any application of the USBC; rather by sympathy for the property owner who would likely have to endure a costly excavation and replacement of the sewer lateral to correct an insufficient slope in the pipe. The County further argued that after review of the required preinstallation video, the County failed the inspection noting that the pipe had insufficient slope and was holding water. Lastly, the County argued that the CIPP installation was a non-compliant installation based on the USBC requirements.

50 Freedom argued that it disagreed with the County's insinuation that the local appeals board 51 made its decision solely on sympathy for the property owner having to endure a costly repair of 52 the sewer pipe through conventional means, rather than a correction to the sewer pipe that is back 53 graded and appropriate enforcement of the USBC. Freedom also argued that the sewer pipe had 54 been working properly for the past 11 months since the CIPP installation. Freedom argued that

2

55	the standards laid out by the County in the modification approval letter were not consistent with
56	the variety of uses of CIPP and that the approval standards of the County were limiting and
57	prohibitive for great candidate host pipes for the installation of CIPP. Freedom also argued that
58	the County preapproval requirements for lining require the host pipes to be in "perfect, like new"
59	condition for approval. Freedom further stated that the County treats the installation of CIPP as a
60	replacement procedure rather than a rehabilitation product for deteriorating pipe. Lastly, Freedom
61	argued that in absence of back grade or a belly in the pipe, CIPP installation should be allowed.
62	The Review Board finds that the matter needs to be remanded back to the County to re-
63	evaluate the matter under the 2015 Virginia Existing Building Code (VEBC) and to work with
64	Freedom to develop the proper submission
65	III. <u>Final Order</u>
66	The appeal having been given due regard, and for the reasons set out herein, the Review
67	Board orders as follows:
68	Whether to uphold the decision of the local appeals board and overturn the County that the
69	conditions of the modification granted by the County, under the 2015 VCC, were met
70	regarding pipe slope.
71	The decision of the County and local appeals board is remanded back to the County for
72	reevaluation under the 2015 VEBC and to work with Freedom to develop the proper submission.
73	
74 75 76 77 78 79 80 81	Chair, State Building Code Technical Review Board Date enteredMay 21, 2021

As provided by Rule 2A:2 of the Supreme Court of Virginia, you have thirty (30) days from the date of service (the date you actually received this decision or the date it was mailed to you, whichever occurred first) within which to appeal this decision by filing a Notice of Appeal with W. Travis Luter, Sr., Secretary of the Review Board. In the event that this decision is served on you by mail, three (3) days are added to that period.

VIRGINIA:

BEFORE THE STATE BUILDING CODE TECHNICAL REVIEW BOARD

IN RE: Appeal of Monica and Michael Davis Appeal No. 21-02

REVIEW BOARD STAFF DOCUMENT

Suggested Statement of Case History and Pertinent Facts

1. In March of 2020, the County of Augusta Department of Community Development (County Building Official), the agency responsible for the enforcement of Part 1 of the 2012 Virginia Uniform Statewide Building Code (Virginia Construction Code or VCC), issued a final inspection and a subsequent Certificate of Occupancy to Monica and Michael Davis (Davis), for a single-family dwelling located at 1002 Round Hill School Road, in Augusta County.

2. Shortly after moving into their new home, Davis contacted the County Building Official requesting he come to their home to inspect a variety of issues they had found with the home with attached garage and detached garage.

3. In June and July of 2020, the County Building Official visited the property several times investigating the issues brought forth by Davis. During one or more of these inspections, the County Building Official found several violations. On July 16, 2020, the County Building Official issued a letter to Hendricks and Son General Contractor, LLC citing seventeen (17) code violations.

4. On September 29, 2020, Schnitzhofer Structural Engineers visited the Davis home to evaluate the residence with detached garage and detached garage related to the cited violations in the July 16, 2020 letter from the County Building Official. Schnitzhofer Structural Engineers

drafted a letter dated November 3, 2020, which was received by Augusta County on November 9, 2020. The Schnitzhofer Structural Engineers letter was reviewed and accepted by the County Building Official.

5. Davis filed a timely appeal to the Augusta County Board of Building Code Appeals (local appeals board) for the acceptance and approval of the Schnitzhofer Structural Engineers letter. Davis further appealed to the local appeals board to consider the proposal report from Engineer Solutions and require the builder to approach the cited violations with the suggested analysis process set forth in that report. The local appeals board upheld the decisions of the County Building Official finding that the Schnitzhofer Structural Engineers report was a valid engineering report for the Davis' structure.

6. On February 1, 2021, Davis further appealed to the Review Board.

7. This staff document, along with a copy of all documents submitted, will be sent to the parties and opportunity given for the submittal of additions, corrections, or objections to the staff document, and the submittal of additional documents or written arguments to be included in the information distributed to the Review Board members for the appeal hearing before the Review Board.

Suggested Issues for Resolution by the Review Board

1. Whether to uphold the decision of the County Building Official and the local appeals board that the Schnitzhofer Structural Engineers report is a valid report for the Davis structure.

CERTIFIED MAIL

Hendricks & Son General Contractor, LLC 604 Hilltop Drive Staunton, VA 24401

Dear Mr. Hendricks:

On 6/10/20, 6/25/20 and 7/8/20 our office visited the Davis house, located at 1002 Round Hill School Road, to inspect concerns they have with the house you constructed under permit #718-2019. This house was constructed under the 2012 edition of the International Residential Code as amended by the Uniform Statewide Building Code. This letter is a report on our findings based on those inspections.

After review of the owner's concerns, inspections of those items, and inspections of the structures, I have concluded that the following items are not in compliance with the building code and need to be corrected:

- 1. The foundation on the detached garage does not comply with code sections R403.1.1 and R403.1.4.1.
- 2. Floor in detached garage is not sloping to the doors in accordance with section R309.1.
- 3. Sill plates in detached garage and house need anchor bolts within 12 inches of each sill plate splice in accordance with section R403.1.6. Need to correct to section R403.1.6 or provide an engineered design and approval in accordance with section R301.3.
- 4. Fascia trim on detached garage does not extend up behind the drip edge on the detached garage and the fascia is not protected per section R703.
- 5. Vinyl siding on detached garage and house not installed in accordance with the manufacturer's installation instructions.
- 6. Some of the roof trusses are not installed in accordance to the manufacturer's specifications. An engineer will need to evaluate and design the necessary repairs and approve those repairs once made.
- 7. Back porch floor beams not properly anchored with appropriate hangers to band board of house. Second option is to provide post with proper connector to beam to an approved foundation. Third option is to provide engineered design and approval in accordance with section R301.1.3.
- 8. Floor joist are not all installed in the joist hangers to manufacturer's specifications. Need to correct to manufacturer's requirements or provide engineers design and approval in accordance with section R301.1.3.

Staunton (540) 245-5700
- 9. Need an architect or engineer to evaluate, design and approve the walls of the attached and detached garage as shears walls per section R301.1.3 as these walls cannot meet the prescriptive requirements for wall bracing in the residential code.
- 10. Front stairs exceed allowed slope of 2 percent per section R311.7.7.
- 11. Provide manufacturer's installation instructions that PVC trim boards are installed in accordance with manufacturer's specifications. They show excessive uncontrolled expansion.
- 12. Per numerous photos of owner's taken after drywall finishing but before paint, the drywall was not secured in accordance with table R702.3.5. Need to correct to table R702.3.5 or provide an engineered design and approval in accordance with section R301.1.3.
- 13. Header at master bath toilet where floor joist was cut was not installed to code. Need to correct to R502.10 or provide engineered design and approval in accordance with section R301.1.3.
- Door in half bath in garage does not meet fire resistant requirements of R302.5.1. Need to replace with 1 3/8" solid core wood door, steel door or 20 minute fire door in accordance with section R302.5.1.
- 15. Grade to left of front stair needs to have proper grade in accordance with section R401.3 so that water will not pond behind sidewalk. (grade currently lower than sidewalk)
- 16. Dryer vent is installed in violation to section M1502.3 as it is within 3 feet of foundation vent which is a building opening. It needs to be rerouted to an approved location. Screws holding the duct together cannot protrude more than 1/8" into the duct. Duct cannot exceed 35 feet in equivalent length taking into account reductions for fittings in accordance with section M1502.4.4.1.
- 17. In addition we have been contacted by the owner that the attic access door is 22" X 22" instead of the 22" X 30" as required by section R807.1. You will need to check and correct if necessary.

Please contact our office within 14 days of receipt of this letter with a timetable to correct these violations.

Sincerely,

G.W. Wiseman Building Official

Report Issue Date:	11.03.2020
PROJECT NAME:	1002 ROUNDHILL SCHOOL RD
S&A PROJECT ID:	20-081

REGARDING:

STRUCTURAL ASSESSMENT

Dear Jay:

A licensed structural engineer (P.E.) from Schnitzhofer & Associates, LLC (S&A) visited the residence located at the above listed location on September 29, 2020. The purpose of the site visit was to document the condition of the exposed, visible, in-place structural elements related to the following:

Primary House

Foyer Foundation Simpson Hanger Connection Roof Beam Overbuilt Trusses Roof Sheathing Plane Drywall Roof Truss at Front Bedroom Crawlspace Pier Location Joist Blocking at Crawlspace Plumbing Crawlspace Ventilation Anchor Bolt Spacing

Detached Garage

Garage Portal Frame Concrete at Corner of Foundation

Dear Jay,

A licensed structural engineer for Schnitzhofer & Associates, LLC, further referred to as S&A, has visited the project jobsite, in the interest of addressing the potential framing issues presented to us. The purpose of our site visit and subsequent report is to provide our opinion regarding the acceptability of the visible structural foundation and framing element conditions present in the field.

Introduction

James R. Schnitzhofer, P.E. visited the home on September 29th 2020. Mr. Schnitzhofer was accompanied by Nate McConaughey, a licensed structural engineer from our Staunton branch. The owners of the property were also present. Mr. Schnitzhofer is an expert in structural consulting and has overseen 1500 structural engineering design projects throughout Virginia, and the "Valley". During his tenure at the head of Schnitzhofer & Associates, he has become intimately familiar with all aspects of local construction norms, standards of practice, standard of care, and construction craftsmanship. During the site visit completed recently, Mr. Schnitzhofer immediately noticed the high caliber construction that was in place. Generally, the quality of detail with regards to craftsmanship, and overall quality installation of the in place primary house framing and foundation systems, all appeared to be exceptional, compared to many counterpart contractors within this area.

Findings and Recommendations (Primary Residence)

1. Foyer Foundation

S&A Response: The front foyer framing appears to bear directly onto the CMU foundation wall. It is our understanding that this condition was inspected by, and approved by, the building inspector. Given the visible framing conditions present at the site, it is the opinion that this foundation system has been installed in general conformance with standard construction practice for this region.

2. Simpson Connections/Hangers At Floor Joists

S&A Response: The floor joists appear to adequately bear into the joist hanger seat. It is our understanding that this condition was inspected by, and approved by, the building inspector. The shear nails appear to be attached through the shear hanger fasteners holes, and potentially fall short of penetrating the supporting beam. In the interest of making a final determination regarding the adequacy of this connection, a licensed structural engineer from our firm contacted the technical/engineering division of Simpson Strong Tie. We discussed in detail the condition present at this location. Based upon the outcome of that conversation, it is our opinion that the connection is acceptable for safe and continued occupancy. For further clarification regarding this matter, we suggest that the owner contact a licensed structural engineer, in the interest of having them explain the material behavior and stress dynamics that Simpson uses for their load tables.

39

3. Roof Beam

S&A Response: The roof beam in question appears to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, we have determined that though a structural analysis of the subject beam, the beam is adequate to safely support the gravity loads at this location. From a construction standpoint, it is the opinion of S&A that the beam is installed in general conformance with the standard of care of this region.

4. Overbuilt Trusses

S&A Response: The overbuilt trusses in question appear to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, it is the opinion of S&A that the overbuilt trusses are installed in conformance with standard construction practice. In fact, the method in which the overbuilt trusses have been installed, is the method our firm recommends. In light of this, it is our opinion that this is not a structural issue.

5. Roof sheathing Plane at Overbuilt Trusses

<u>S&A Response:</u> The sheathing over the overbuilt trusses in question appear to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, it is the opinion of S&A that the sheathing at this area is installed in conformance with standard construction practice. It is very common that minor fluctuations within the roof sheathing plane occur with a complicated roof truss system such as the one present at this home. More specifically, it is our opinion that the roof sheathing installation is within generally acceptable tolerable limits for a framing project of this type.

6. Drywall – Bonus Room

S&A Response: It is our understanding that a majority of the drywall hanging installation at this area was completed by the homeowner – not the contractor. Generally speaking, drywall installation within pre-engineered bonus room truss web members is more complicated than installation onto a standard stick framed structure. As a result of the variations in roof truss profiles and anticipated movement/expansion/contraction of the truss web and chord members, it is generally understood that the anticipated likelihood of a perfect "finish plane" is very low. In light of this, it is the opinion of S&A that the drywall at this area is in a condition that one would expect for installation at the interior of the pre-engineered wood truss web members. The drywall within the primary structure, however, appears to have been installed in an exceptionally well manner, and appears to have a very high quality "finish plane" overall.

Davis Residence: Structural Assessment 11.03.2020 41 P a g e

7. Roof Truss at Front Bedroom:

S&A Response:

While at the site, the homeowner indicated to our engineer that there was a potential problem with the truss bearing over the front bedroom. It is our understanding that this condition was inspected by, and approved by, the building inspector. However, it is our pinion that the homeowner misunderstood the behavior of pre-engineered trusses, and appears to have applied a faulty understanding of this condition. It is our opinion that the truss bearing does not occur as the homeowner suggested, and that the trusses within his area appear to have been installed correctly, and in accordance with generally accepted practice. Overall, we found that the roof system framing is in very good condition, and was installed in conformance with generally accepted construction practices for this area.

8. Crawlspace Pier

S&A Response: Based upon the assessment of the piers within the crawlspace, we found that the piers have been installed in conformance with generally accepted construction practices. It is our understanding that this condition was inspected by, and approved by, the building inspector. Additionally, based upon our assessment of the adjusted loading condition as a result of the 2" offset mentioned by the owner, it is our opinion that this condition is acceptable and is not in need of structural reinforcements.

9. Joist Blocking at Crawlspace Plumbing

S&A Response: It is common that alternate framing configurations are used in construction of this type. These are commonly referred to as "field adjustments". In this case it appears that the contractor supported the plumbing supporting joists with a standard "bulkhead" framing adjustment. It is our understanding that this condition was inspected by, and approved by, the building inspector. However, this minor framing adjustment could easily be strengthened by the installation of one new joist, immediately adjacent to the compromised joist. Given the circumstances, this repair would entail about \$50 in materials, and about 20 minutes to complete. A new Simpson face mount joist hanger could then support the cross member(s), 'bulkhead". Finally, this issue is extremely minor and, under no circumstances would this rise to the level of a legal dispute, or the idea that the contractor has provided work that is not in conformance with the standard of care of this area. Additionally, this does not indicate that the structure is "unsafe".

10. Crawlspace Ventilation

S&A Response: Based upon our calculations, Schnitzhofer and Associates, LLC found that the crawl space ventilation area provided does exceed the required area. We recommend review by the building official, in the interest of approving the removal of the vent adjacent to the dryer vent. Specifically, the building official will need to approve the removal of a vent within 3 feet of a building corner.

Davis Residence: Structural Assessment 11.03.2020 51P a g e

11. Anchor Rods

S&A Response: Based upon our assessment, Schnitzhofer and Associates, LLC found that the anchor rods are spaced as needed to satisfy the spacing requirements within the building code. However, there may be the need for additional anchors to be installed at the locations where the sill terminates. This operation is relatively easy and cost effective to accomplish. It is our understanding that this condition was inspected and approved by the building department. However, if you are in need of this reinforcement design, please contact S&A and we will prepare a quote for the retro-fit anchor installation specifications.

Findings and Recommendations (Detached Garage)

12. Braced Frame/Portal Frame at Garage Doors

S&A Response: It is the understanding of S&A that the garage portal frames have been installed as directed by the building inspector, have been inspected, and ultimately approved by the County. However, we understand that the inspector now believes the framing is inadequate. In light of this, we believe that, by the introduction of additional shear wall length (Approximately 4 feet), new hold down anchors, and minor foundation reinforcement, the portal wall can be reinforced to adequately support the anticipated lateral loads. Specifically, we suggest the removal of the 10 ft x 10 ft doors, installation of two new, 2 foot braced walls in each bay, removing and infilling the man door, then replace the existing garage doors with new doors to fit the adjusted openings. This work would be completed in conjunction with foundation reinforcements as needed to provide adequate anchorage for load path to foundation continuity, in the interest of resisting overturning forces present in the shear walls. Contact S&A for a design of the final braced wall and foundation reinforcement specifications, if needed.

13. Concrete at Corner of Foundation

S&A Response: It is the understanding of S&A that the corner of the garage foundation has been exposed to reveal the slab edge. During the time of the site visit, approximately 2-3 feet of the turn down slab foundation was exposed. If the frost depth needs to be met at this location, we suggest pouring additional concrete at this area, to comply with the local building department frost depth requirements. This is a very easy solution to this condition. We have not reviewed or commented on any foundations that were not exposed during the time of the site visit.

Executive Summary

A licensed structural engineer from Schnitzhofer & Associates, LLC visited the home and completed a visual assessment of the in-place framing within the interior of the primary home, including the bonus room and the attic framing area. Based upon our many years of review of residential construction in this area, other than the minor recommendations for framing adjustments listed above, we have found that the overall framing we were asked to review within the primary home is in conformance with generally accepted construction practices for this area. Additionally, we believe that workmanship represents an appreciation for the standard of care one would expect under the conditions present of this home.

LIMITATIONS

While Schnitzhofer & Associates, LLC has completed a visual assessment of the above listed items, we were not provided the photographs shown to our staff during the site visit. A review of these photographs would be beneficial to resolving the framing questions posed by the owner. If you would like us to comment on the framing that is covered up, we suggest providing our engineers with the photographs showing the areas in question. Otherwise, it may be useful for the home occupants to demo the interior finishes where they believe a structural framing issue exists, and have their engineer review these framing elements. If their engineer then believes that there is a framing deficiency, then they could forward those findings to you for additional review. Overall, it is our understanding that neither the building official, our engineer, nor any other engineer, has found a framing issue within the roof framing viewed by our staff while inspecting the attic framing during the site visit, and, as such, it is logical to assume that demolishing the drywall is not warranted at this time. Generally, there would need to be significantly more damage to the interior finishes, for an engineer to believe there is a structural defect in the overall framing system. Currently, the evidence of a framing deficiency is not visible. We have only completed an assessment of the items in question listed above. We are happy to provide a full structural analysis of the home. However, based upon our assessment while at the site, we don't feel this is necessary. Should you be in need in of a full analysis of the home, please contact us and we will prepare a proposal for services.

Schnitzhofer & Associates, LLC are happy to provide this structural assessment report with regards to the project located in Crimora, VA. Please feel free to contact us at 540-448-8321 at any time to discuss this structural report.

Sincerely,

James Ray Schnitzhofer P.E. President

COUNTY OF AUGUSTA COMMONWEALTH OF VIRGINIA DEPARTMENT OF COMMUNITY DEVELOPMENT P.O. BOX 590 COUNTY GOVERNMENT CENTER VERONA, VA 24482-0590

Appeal No.

REVISION Dropped Off @ the Government Center, Tuesday December 8, 2020 @ 8:00 AM

Application for Appeal

Augusta County

Locality

I (we) Monica and Michael Davis of (name) of <u>1002 Round Hill School Road Crimora VA 24431</u> (mailing address)

respectfully request that the Local Board of Appeals review the decision made on

November 16, 2020 , by the code official. Via email to the Davis November 17,2020

Description of Decision Being Appealed: <u>All items on report dated November 03, 2020 from James</u> <u>Schnitzhofer with Schnitzhofer & Associates, LLC. Report was received at the Augusta County Office</u> November 9, 2020

Location of Property Involved: <u>1002 Round Hill School Rad</u>

What is the applicant's interest in the property?

X Owner

Relief Sought: <u>We request the board review the provided report and determine that the proper required</u> analyzes and new design in reference to the structures current state was not provided that was required by the county official in the notice of violations that was served. As stated only visual inspection were performed. Visual inspections were performed by the Head County Building Inspector and determined to be in violation of the USBC. We request the board consider the proposal report provided by Engineer Solution and require the builder to approach the issues at hand with the appropriate analysis that Engineer Solutions is suggesting in their report and be the new requirement for the required analysis and new design. That decision would require the builder to utilize the proposal set forth by Engineer Solutions and hire that party to compete the analysis process that we the homeowners have already started.

Attach the Decision of the Code Official and Any Other Pertinent Documents.

Statement of specific relief sought

Our request for specific relief sought is to require the proper inspections be performed and require penetration of walls and other parts of the structure and requiring analysis with mathematic calculations and new design to be provided for all the items on the engineers report. Some items called out on the engineer report do not actually address the code violation so we request the board review those as still being in violation and review attached documents to support the violation in review. The codes that are referred to are reference to what we the homeowners think is the general direction for the violation BUT if the board views other issue that are in violation we request that the code that has been sighted be changed to address any new direction for violations or add additional items to the appeals.

Item 1: on the NOV for the foundation on the detached garage **Code R403.1.4.1** Frost protection. Except where otherwise protected from frost, foundation walls, piers and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods, as well as **Code R403.1.1** Minimum size. Minimum sizes for concrete and masonry footings shall be as set forth in Table R403.1 and Figure R403.1(1). The footing width, W, shall be based on the load-bearing value of the soil in accordance with Table R401.4.1. Spread footings shall be at least 6 inches (152 mm) in thickness, T. Footing projections, P, shall be at least 2 inches (51 mm) and shall not exceed the thickness of the footing. The size of footings supporting piers and columns shall be based on the tributary load and allowable soil pressure in accordance with Table R401.4.1. Footings for wood foundations shall be in accordance with the details set forth in Section R403.2, and Figures R403.1(2) and R403.1(3). YOU WILL FIND THIS UNDER NUMBER 13 ON THE ENGINNERS REPORT FROM SCHNITZHOFER. Be informed per number 13 verbiage the only part of the garage foundation that was addressed was a 2-3 foot corner that was exposed. Code R403.1.4.1 speaks to the foundation as a uniform unit not a just a small portion that is being addressed in the engineers report.

The provided images will show two different locations of the supposed footing that was exposed on opposite ends of the same wall of the structure and will show the same findings in both locations, that there is no footer. After reviewing the provided engineers report from our builder and the abnormal suggested repair for pouring additional concrete in the hole IF the frost depth needs to be met. The engineer clearly confirms an issue with the concrete as did the County Building Official. The engineer states only approximately 3 feet of the slab was exposed which is accurate. TO show the slab has the same nonexistent footing the slab was exposed on the opposite end if the same wall of the of the structure and it was discovered to be just as the same findings in the other exposed location that there is no turn down footer on this structure as code requires. We request proper analysis be performed on the entire perimeter of the concrete slab requiring it to be exposed and require a new design be provided if a new design cannot be provided to utilize the space as its original intentions the we request a honest approach to what should be the outcome of the structure.

Please be advised that the concrete itself also fails under item 2 on the NOV letter for code R309.1 as it indicates on the report the concrete does not slope toward the doors. Sadly the violations for this structure do not stop there. Again it failed under item 3 R403.1.6 for sill plate anchor bolts. Yet again under number 4 on the NOV per code R703 for weather-resistant exterior wall envelope, number 5 for the vinyl siding fall off, number 9 for the 12 foot walls with no additional bracing. Last but not least not on any report because it was just discovered the required wall blocking for wind in code R?????? For the detach garage structure is in violation of that code as well. At what point in relation to the code do you determine that the structure is in violation of entirely too many key structure codes that compromises the safety and integrity of the structure is in no way sound and should be demolition and rebuilt? The structure was to be designed to utilize and install an automotive lift to be able to perform maintenance to our own automobiles. As well as house and park our oversized truck. The need for the 10x10 foot doors on this structure is a must as the automobile we want to house in it is measure over 7 ½ feet in height and 8 1/2 feet in width.

2x4 setting on the concrete slab and not a pressure treated sill plate.

Image taken 01/23/21 @ 12:13 PM by Monica Davis Detached Garage wall sheathing and 2x4 wall stud show only off the finishd grade 4 inches Image taken 01/23/21 @ 12:13 PM by Monica Davis Detached Garage left back corner dug out showing no turn down footer. Slab only extends 10 inches in the ground and not 24 inches like the code requires

10 11 42

Image taken 01/23/21 @ 12:13 PM by Monipa Davis Detached Garage front left corner shows the slab with what the builder called a footing is in total only 13 inches thick

Item 3 : on the NOV for the sill Plate anchor bolts on the house and garage code **R403.1.6Foundation anchorage**. Sill plates and walls supported directly on continuous foundations shall be anchored to the foundation in accordance with this section. Wood sole plates at all exterior walls on monolithic slabs, wood sole plates of braced wall panels at building interiors on monolithic slabs and all wood sill plates shall be anchored to the foundation with anchor bolts spaced a maximum of 6 feet (1829 mm) on center. Bolts shall be at least 1/2 inch (12.7 mm) in diameter and shall extend a minimum of 7 inches (178 mm) into concrete or grouted cells of concrete masonry units. A nut and washer shall be tightened on each anchor bolt. There shall be a minimum of two bolts per plate section with one bolt located not more than 12 inches (305 mm) or less than seven bolt diameters from each end of the plate section. Interior bearing wall sole plates on monolithic slab foundation that are not part of a braced wall panel shall be positively anchored with approved fasteners. Sill plates and sole plates shall be protected against decay and termites where required by Sections R317 and R318. Cold-formed steel framing systems shall be fastened to wood sill plates or anchored directly to the foundation as required in Section R505.3.1 or R603.3.1. Interior braced wall plates shall have anchor bolts spaced at not more than 6 feet (1829 mm) on center and located within 12 inches (305 mm) of the ends of each plate section when supported on a continuous foundation. YOU WILL FIND THIS UNDER NUMBER 11 ON THE ENGINNERS REPORT FROM SCHNITZHOFER. Be informed per number 11 verbiage it states that the anchor rods are spaced as needed to satisfy the space requirements within the building code .That is inaccurate information.

The provided images will show we do not have the minimum of one anchor within 12 inches on the end of each plate as well as we have some locations with no anchors. Below you will find several images that show we have sill plates that have NO anchor bolts at all as well as plate sections that only have ONE anchor per sill plate, and locations that do not have the required anchor within 12 inches of the end of the plate and 90% of the nuts and washer do not comply because they are not tight. You can actually take them off with your hand and no needed tools. The nuts and washers are not even snug some nuts are just screwed down one or two threads making no contact at all with the washer or sill plate. The NOV for number 3 states "Need to CORRECT to section R403.1.6 OR PROVIDE an engineered design and approval in accordance with R301.3". Number 11 in the engineer reports states they will prepare a quote for retro-fit anchor installation specifications. The verbiage clearly indicates that they have in no way, shape or form instructed the builder how to correct or provided an engineer design and approval. So we request the board require to inforce the verbiage in the NOV and require it to be CORRECT to section R403.1.6 OR PROVIDE an engineered design and approval in accordance with R301.3.

Item 6: on the NOV for the Roof trusses are not installed in accordance to the provided engineers truss design.

YOU WILL FIND THIS UNDER THE FOLLOWING NUMBERS 3, 4, 5, & 7 ON THE ENGINNERS REPORT FROM SCHNITZHOFER.

As it was stated to me by David Laurance the representative for UFP – Mid-Atlantic which is the company that designed the truss system and stamped them with the engineers seal for our dwelling. Mr Laurance said when a truss design is engineered an engineer has all the necessary calculations to ensure the proper design for the application. When created the design accounts for variables they anticipate the live load variable will change due to weather like snow, ice, sleet and so on. With that said the sealed stamp and approved design should never change once all calculations have been completed and the design put in to motion meaning the trusses being built and installed. He went on to say that all of the trusses are a system and damage to one part of the system affects the whole system. If one truss alone is moved, damaged or broken the system loses integrity in two planes: vertical and horizontal. Mr Laurance went on to say it would be a mistake to brush off what looks to be minor because I assure you the defect is not as localized as it appears, the entire system is compromised. Our conversation went on to discuss trusses being load bearing on interior walls that the design clearly calls out was not taken into account for. He said Mrs. Davis it's not rocket science in that aspect, if the truss are setting on the walls its bearing weigh. I went on to ask about the design calling out the 24" OC when set and he said what's to question it's a design not Legos you move where ever you want you move one truss outside of what the design calls for you compromise the entire system and its strength integrity. I ask if my truss design was in any way "overbuilt: as Schnitzhofer Enginner report called out? He said no its only built to withstand what the truss design information calls out, and if you have in any way not constructed it to that design then I can't even say that it withstand what is on the paper if you have shifted point loads and moved trusses outside of the original design. The images below will clearly show our original truss design has been compromised in not just one way but several. We have trusses that are more than 26 inches on center when the design clearly calls out for 24 inches on center. We have trusses that are resting on interior walls and the design clearly states that they are not design for that. We have a very important LVL beam that is part of the truss design that was installed in the ceiling and not in the floor. Images will show in the locating where that LVL beam was to be installed per the design we have a 2X10. To makes madders worse the floor is so messed up in that location they have all load bearing trusses setting on a 2X4 with scabs of press wood under it. To add yet another major issue the hangers that you can see have no hardware at all in them. Also in the same location we have trusses that the gap between the hanger and joining band board you can get your entire hand in the gap is so big. Last but not least the construction of the trusses clearly show in the provided images the roof sags and bulking we have going on.

The engineer report in number 3 states that "through structural analysis of the subject beam" in question for this is the LVL in the ceiling that belongs in the floor. If you go to page 6 of that same report under Limitations in the third line from the bottom. It states "we have only completed an assessment of the items in question and it goes on to say they are happy to provide a full analysis of the home, clearly calling out that no analyzes was ever even performed just visual opinions. In number 4 of the same report it calls out overbuilt trusses but was confirmed through the truss design company that we have no such thing. Number 5 of the same report speaks t the sheathing. It calls out "at this area" we are unsure what area that is. So we request the board require the trusses be corrected to the original design that was provided by UFP Mid Atlantic meaning removing the LVL that was installed in the improper location and installing it where it belongs, correcting the trusses to be the required 24 inches on center as the design required. Correcting the trusses that clearly were set higher and have the roof sheathing either sagging or raised.

Image taken by MOnica Davis shows how messed up and off the roof is. How it that truss carring any load at all if the sheathing doesn even tough it.

> image taken by monica davis shows larg hanger connected to nothing

Item 8: on the NOV for the Floor Joist installation in joist hanger. **R301.1.3Engineered design.** When a building of otherwise conventional construction contains structural elements exceeding the limits of Section R301.1 or otherwise not conforming to this code, these elements shall be designed in accordance with accepted engineering practice. The extent of such design need only demonstrate compliance of nonconventional elements with other applicable provisions and shall be compatible with the performance of the conventional framed system. Engineered design in accordance with the *International Building Code* is permitted for all buildings and structures, and parts thereof, included in the scope of this code. YOU WILL FIND THIS UNDER NUMBER 2 ON THE ENGINNERS REPORT FROM SCHNITZHOFER.

The provided images will show the supporting documents and emails from Greg Bundy Simpsons Strong Tie Senior Engineer. I have personally spoken with Greg on numerous occasion. I reached out to him again on January 19 to insure I did not in any way miss understand what we had discussed. I quoted the verbiage from Schnitzhofer report under number 2 that someone from that firm called the technical division and it was discussed in detail the conditions present at this location and based upon that it was the opinion that the connections is acceptable for safe and continued occupancy. The report goes on to say I should have a structural engineer explain the material behavior and stress dynamics that Simpsons Load table uses. What better person to get clarification from than an equal professional an engineer that works for the manufacture company that makes the product in question. Greg stated my issues have nothing to do with the material and stress load tables Simpsons has published in their literature. My issue falls under the allowable fastener technique that was used for hardware and allowable gaping between the fastener and the floor joist. Senior Engineer Gregory Bundy with Simpson Strong-Tie personally sent me literature that is published on the improper install of the floor joist hangers LUS210. Mr. Bundy indicated that builders performed the improper install using the 10D one and a half inch nail so much that they felt it was necessary to address and provide literature to all consumers of the appropriate repair. He informed me at that time as they have in the past personally. They always point individuals to the literature that is provided on the web page. It was stated no one at strong tie would ever tell someone that a particular install was ok when it is clearly called out on their literature that it is improper. Mr Greg Bundy went on to request that I attempt to get the individual that the engineer firm supposedly spoke with so they could in house address the allegation that such individual was providing inaccurate information. I was unable to do so. The images provided show we have large gapes for the LUS210 hanger that is clearly stated on Simpsons Literature is not allowed. Along with the documents referring to the double sheer nails and the current install not being acceptable. As I have 1 1/2 inches nail that do not even penetrate the floor joist where the double sheer nail calls out to be installed that I should have a minimum length of 3 inches to achieve the publish load tables. Below is two separate emails with Greg one from November and one from January. The January was to just reassuring me that the information we had spoken on in the past is still accurate and the suggested repair avenues.

From: Greg Bundy <<u>gbundy@strongtie.com</u>> Date: November 10, 2020 at 4:01:05 PM EST To: <u>monica.davis27@comcast.net</u> Subject: SST Literature

Hi Monica,

Attached is the literature you requested.

□ T-C-HANGERGAP18 – Allowable Loads for Joist Hangers with Gaps

 $\hfill\square$ L-C-LUSREPAIR19 – Repair of LUS Joist Hangers Installed with 10dx11/2" Nails

60

I hope the information herein will assist you.

Sincerely, Greg Gregory D. Bundy, P.E. | Senior Engineer, Northeast USA | Simpson Strong-Tie | 614-850-4023

<u>Attachment # 1</u> TECHNICAL BULLETIN

Page 1 of 6

As a requirement of the building codes, Simpson Strong-Tie[®] joist and truss hangers are tested in accordance with approved standards which define how to construct the test setup, how to load the assembly, and how to interpret the results. The test standards for these hangers, ASTM D7147 and ICC-ES AC13, require that they be tested with a 1/8" gap between the end of the carried member and the carrying member. Therefore, for hangers to achieve the full published allowable loads, the same conditions must be met in the field, i.e., that gaps between the carried member and carrying member not exceed 1/8".

Testing performed by Simpson Strong-Tie has indicated that joist and truss hanger allowable loads are decreased when larger gaps are present. The amount of decrease in allowable load depends on the size of the gap, the type of hanger used, and the type and location of fasteners. Figures 1 and 2 below illustrate two ways in which gaps affect performance.

(b) Gap Larger Than 1/8"

Figure 2 – Effects of Gaps on Double Shear Nailing for Uplift Capacity (Top View)

If a gap larger than 1/8" exists between the end of a carried member and the girder, the reduced capacity of the connection must be evaluated. Testing was performed to establish allowable loads for common truss hangers with gaps up to 3/8". These allowable loads are shown in Tables 1 and 2. Testing was also performed to determine possible field remedies and repair scenarios when needed for a gap condition. Based on these additional tests, some possible repair options are provided on pages 4 and 5 for use by the Truss Designer or another design professional.

RECOMMENDED ACTION FOR HANGERS WITH GAPS LARGER THAN $1\!/\!8"$

 In all cases involving a gap between the end of a carried truss and the girder that exceeds 1/8", the truss manufacturer should be notified to ensure that the truss is not adversely affected by the gap. In addition, all field remedies and repairs for gaps must be designed and approved by the Truss Designer or another design professional. For gaps up to 3/8", refer to the allowable loads in Tables 1 (DF/SP) and 2 (SPF/HF). (Note: Allowable loads for HTU hangers with gaps up to 1/2" are given in Table 6.) If the reduced allowable loads for a gap greater than 1/8" meet or exceed the design loads (download and uplift) for the hanger, the hanger is adequate and requires no repair to carry the loads. If any design load exceeds the corresponding allowable load, a repair or field modification is required to meet the design loads. See pages 4 and 5 for some possible repair options.

For gaps greater than 3/8" (1/2" for the HTU series), a repair is required unless otherwise approved. See page 5 for some possible repair options.

Re: Repair of LUS Joist Hangers Installed with 10dx11/2" Nails

To Whom It May Concern:

Simpson Strong-Tie[®] LUS joist hangers require common joist nails with a minimum length of 3" to achieve the published load capacity. Simpson Strong-Tie does not support the use of 10dx1½" nails (0.148" dia. x 1½" long) into the double shear nail dome due to their lack of penetration into the header. The table below provides allowable loads for several LUS joist hangers installed and repaired with Simpson Strong-Tie Strong-Drive[®] SD Connector screws as follows:

- 1. 10dx1¹/₂" nails have been installed into the and the joist.
- 2. All of the 10dx1¹/₂" joist nails have been without damaging the LUS joist hanger.
- 3. #9x2¹/₂" SD Connector screws have been into the joist using the dome nailing feature.
- 4. All other installation instructions found in the *Wood Construction Connectors* catalog have been followed.

1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed. Reduce where other loads govern.

2. **FASTENERS:** 10dx1¹/₂" = 0.148" dia. x 1¹/₂" long nail, SD #9x2¹/₂" (model SD9212) = 0.131" dia. x 2¹/₂" long structural-connector screw.

The information in this letter is valid until **12/31/20** when it will be re-evaluated by Simpson Strong-Tie. Please visit <u>strongtie.com</u> for additional pertinent information. If you have questions or need further assistance regarding this matter, please contact the Simpson Strong-Tie engineering department at 800.999.5099.

Sincerely,

SIMPSON STRONG-TIE COMPANY INC.

HERE IS THE SECOND EMAIL WITH MR BUNDY AND HE CONFIRMS THAT THE INFORMATION IS INDEED ACCURATE AND SHOULD BE USED AS A REFERENCE FOR REPAIRS.

From: Greg Bundy <<u>gbundy@strongtie.com</u>> Date: January 26, 2021 at 9:47:24 AM EST To: Monica Davis <<u>monica.davis27@comcast.net</u>> Subject: RE: SST Literature

Hello Monica,

Attached is the current version of T-C-HANGERGAP and L-C-LUSREPAIR. This information is accurate and should be used for reference.

NOTE: The only difference between the literature I emailed you in November and this literature is the expiration date.

• T-C-HANGERGAP18 – new expiry date of 06/21

L-C-LUSREPAIR21 – new expiry date of 12/31/22

Hope this answers your questions.

Sincerely,

Greg

Image taken 01/18/21 by Monica Davis Image shows double shear nails do not even penetrate the header board

Image taken 01/18/2021 by Monica Davis image shows gape between floor joist and band board are more than twice the allowable gap

Image taken 01/26/21 @ 11:18 AM by Monica Davis Image shows the gap between the hanger and header are 1/4 of an inch. Simpson Literatue states gaps up to 1/8 inch.we have twice the "up to" allowble. Simpson states our hanger the LU5210 is not allowed a gap that the hanger has to be replaced

We request the floor joist hangers be reviewed and both the twice the size of the up to allowable gap and improper hardware be required to be repaired to Simpsons literature.

Item 9: on the NOV for the Shear walls per R301.1.3 attached and detached garage walls. I will be honest when I say I do not fully know how to approach this item as I do not fully understand it. I can make you aware for the detach garage has walls that are the full 12 foot in length with no additional bracing just some inserted after the fact block that images will show are not connected to the sheathing on the outside and can actually be turned a full 360 degrees by hand which clearly add no additional support. YOU WILL FIND THIS UNDER NUMBER 12 ON THE ENGINNERS REPORT FROM SCHNITZHOFER.

Since the code violation calls out two separate location we will start with the detached garage. For clarification this detached garage has two walls that are 12 foot in height that set directly on the concrete and 2 walls that are over 10 foot tall that set on 2 run of cinderblock. One of the 12 foot walls is actually the opening side that has two 10x10 foot garage doors and a man door. Below you will see images that show we have 12 foot walls that are weight bearing that were not engineered to be that way and have no added support. You will also see we have over 10 foot walls that have the same issue. One the engineer report under number 12 it suggest removing the man door all together and down sizing the garage door. The first question that comes to mind is if you remove the man door how do you access the structure?? Second in no way does the engineer address the other 3 walls. They just go on to say in their report to contact them for design of final braced walls and foundation reinforcement. That statement confirms as the county official sited the structure for violations that it indeed is in violation and needs correcting.

Image taken @ 1:21 PM by Monica Davis 1/26/21 image shows blocking in wall between studs that sheething should be attached to is not.Blocks can be moved with your hands. location detached garage

Still in Item 9 but moving to the attached garage we have the same issue but to me a much bigger problem. We have 11+ foot walls in this location as well but on top of that directly above this location is a second story bonus room. All is resting on the 2x4 walls that average 11+foot in height and have no additional wall bracing and the added weight of the second story. The attached garage has 3 walls that are 11+ feet tall and has a second story above it PLUS the double garage door opening below it as well.

showing 11+ foot walls in attached garge with no added support and a second story

image taken by monica davis showing attached garage with second story is over 11 foot in height

We request the board review the wind requirements for the exterior sheeting on both the attached and detached garage because neither structure have additional blocking. As well as address the 12 and 11 foot walls in both structures. The ridicules suggestion the engineer suggest of removing the man door (how are you to get into the structure) downsizing the door (how are we to store our vehicle in it). Again it states we the owners should contact for a design clearly calling out no analysis was taken into consideration when suggestion this silly approach.

Item 12: on the NOV for the drywall being secured in accordance with table R702.3.5

YOU WILL FIND THIS UNDER NUMBER 6 ON THE ENGINNERS REPORT FROM SCHNITZHOFER.

Below you will see images show we have nowhere near the required hardware securing our drywall to ceiling and walls. We have entire sheets that have no drywall screw or nail in the field at all. We have sheets on the ceiling that when we go back and look at pictures show only 2 and 3 nails in the field those sheet now are sagging. NONE of our images were shown to the engineer when he performed a site visit. His report only speaks to the "finish plane of the drywall and no way addresses the violation that was sighted for being secured. We request the board require the drywall to be secured to the requirement set forth in section R702.3.5

Image taken by monica davis November 2019 shows not in accordance to code BE ADVISE THIS WALL IS IN THE ATTACHED GARAGE AN ENTIRE 4X12 SHEET WITH only 3 pieces of hardware in the field to secure

Image taken by monica davis November 2019 shows not in ccordance to code BE ADVISE THIS WALL IS ABOVE THE TUB SHOWER COMBO AND IS 5 FEET LONG BY 3 FEET HIGH

7/

Item 13: on the NOV for the Header at master bath plumbing R502.10 or provide engineer design and approve in accordance with section R301.1.3 YOU WILL FIND THIS UNDER NUMBER 9 ON THE ENGINNERS REPORT FROM SCHNITZHOFER

The image clearly shows the cut floor joist for plumbing to be installed. We request a proper design be provided and approved in accordance with the code.

Documents Submitted by Monica and Michael Davis

(Page left blank intentionally)

ADDITIONAL DOCUMENTS SUBMITTED

Item 6: Roof Truss System. Provided are additional images showing that the truss system was set more than the 24" OC that the truss design calls out for.

Item 8: Floor Joist Hangers Since we have submitted our appeals the floor throughout the entre dwelling has moved. Images provided of interior nonweight bearing walls that have seprated from the ceiling due to the floor joist and the improper install in the hangers causing the floors to drop. We also provided images throught the dwelling in 3 different location. One in the kitchem, one on the living room and one in the bathroom. All will show that due to the improper insall of the hangers as simpsons literature said would happen the josit are putting forward force on the hanger causing the floor joist and hanger to drop. Images show now how out of level the floor throughtout the entire dwelling is. The code is very vage in reference to flatness and integrity. SO I researched and the next best thing would be the professionals at the National Wood Floring Association. The guidleines they set forth are as follow: Part III – Subfloor Flatness and Integrity A. Wood subfloors must be flat, clean, dry, structurally sound, free of squeaks and free of protruding fasteners. 1. For installations using mechanical fasteners of 11 /2" and longer, the subfloor should be flat to within ¼" in 10 feet or 3 /16" in 6 feet. 2. For glue-down installations and installations using mechanical fasteners of less than 1 1 /2", the subfloor should be flat to within 3 /16" in 10 feet or 1 /8" in 6 feet. Please reference the following images to show we are way out of that standard and guidelines.

Image taken 2/16/21 by Monica Davis @ 11:56 AM. This image shows the tape measure close up in the location in the living room where the floor has dropped 5/8th of an inch

Image taken 2/16/21 by Monica Davis @ 11:56 AM. As indicated would happen by simpson literature due to the gape in the hangers and the improper hardware Joist with gap puts downward force further from header and creates more rotation. This image shows the location in the living room where the floor has dropped 5/8th of an inch

Image taken 2/16/21 by Monica Davis @ 11:54 AM. This image is a close up of the measuring tape shows the location in the kitchen where the floor has dropped 5/8th of an inch.

Item 12: Drywall secure. Images provided below will show the sags that the drywall is experiencing due to the improper fastening procedure that was used. Images provided also show lage cracks that are entire sheets of drywall. The improper way that the drywall was secured has caused over 80% of the drywall throughout the entire structure to crack, bulg, and sag. Due to the fact that not enough fastners were used per the code the weight of the drywall is causing all the drwall to pull away from the walls which is casung the visual cracks. Sheets of drywall are also sagging do to the fact that it was not installed according to code as well as bulges are accuring where there was very few fastners on the perimeters of the sheet and none in the field causng the bulges and nail pops because the sheets just do not have proper hardware to secure the sheets in place. The images provided sole purpose are to review the cracks, bulges, and sagging pieces of drywall on the ceiling and walls and not to be viewed as poor workmanship for the finish.

Image taken by Monica Davis 01/20/21 the purpose of the image it to point out the sags in the drywall due to the lack of hardware to secure the board to the walls and ceilings. A light was use to show the shadow that is projected due to the improper fastening technique and lack of fastners to secure the boards to the wall.

Documents Submitted by Augusta County

(Page left blank intentionally)

COUNTY OF AUGUSTA COMMONWEALTH OF VIRGINIA DEPARTMENT OF COMMUNITY DEVELOPMENT P.O. BOX 590 COUNTY GOVERNMENT CENTER VERONA, VA 24482-0590

February 17, 2021

Office of the State Technical Review Board 600 East Main Street, Suite 300 Richmond VA, 23219

Members of the Board:

As requested, I am providing a detailed explanation and image regarding the code items in appeal at the Michael & Monica Davis property. The appeal number is 21-02.

I believe I need to provide a little background into this appeal.

I was on vacation from November 4 – 15, 2020. The engineers report was delivered to my office on November 9, 2020. On November 17, 2020 Mrs. Davis ask me if I had received the report. I replied that I had. She then ask for my feedback. As I had only briefly read it and had not had time to see if it resolved any issues in my letter to the contractor I replied that "The report was basically as I expected. I was satisfied by his conclusions and thought his repair recommendations would work where they were proposed."

I had not made any decisions regarding any item on the report at this time. On November 24th Mrs. Davis wanted a date at which time I will have made my decisions. I replied that based on my current workload and staffing that I would have my decision by December 16th. At that time Mr. and Mrs. Davis decided to appeal the entire report to the local board. That is why the local board's decision only states that they found the report to be a valid report. I had not yet made any decision on the report.

After going thru all of that, I finally had time to get to the report and decided that the report only fully resolved 3 issues on the contractor's corrections list. The report gave some repairs for other items on the list but until those repairs can be performed they are not resolved.

I will try to address the Davis items in the same order that they did for ease of use.

Item 1: The engineer's report does not say that this is in compliance, however he does give a repair to the issue. The contractor is already going to have to show our office that he has frost line protection all around. When we originally inspected that footing on 12/13/2019, our inspector told me that the contractor had 24" frost line protection all of the way around. It looks to me that they got some dimensions wrong and made the pour wider to correct their error

Staunton (540) 245-5700

Waynesboro (540) 942-5113

without going deeper. They already are going to have to prove to me that they have frost protection.

The Davises' comment regarding the floor slope in the detached garage is already addressed by item #2 on the letter to the contractor. The siding is address by item #5 on the corrections list. The 2X which the Davises' state is in contact with the concrete appears to be part of the garage door frame since it is outside of the wall framing. The garage door frame was addresses in their last appeal and was determined by this board that it is not required to be treated lumber. Please note that until I received the packet from the board I had never seen the photo or been contacted by the Davises about this issue. I have not been able to view it as I was on medical leave from January 27 to February 7 and then Mr. Davis went into Covid quarantine. With respect, I do not know why these issues are being brought up here as they not even mentioned in the engineer's report which is what this appeal is for.

Item 3: The engineer's report does not state that the anchor bolts are in compliance but that additional ones need to be installed within 12 of the sill ends.

Item 6: On my July 8, 2020 inspection, Mrs. Davis showed me a photo of the trusses on the 2 X beam. She stated then that it was supposed to be a LVL. Our office performed the framing inspection on 11/12/2019 and I did not believe we would have missed something like that but out of an abundance of caution, I informed the contactor that an engineer would need to evaluate and approve or design repairs if needed. The engineer's report on item #3 states that the beam is adequate to safely support the loads at this location. He also looked at some additional trusses that were questioned by the Davises' and found them in compliance.

When Mrs. Davis talks about her conversation with David Lawrence, she stated in the local appeals board hearing that she was on a phone call with him. I am not aware that Mr. Lawrence has ever been on site.

Item 8: The engineer evaluated the condition with the joist hangers and consulted with Simpson Strong Tie and determined that the connection was safe for continued occupancy. I know the Davises' are claiming that the engineer never contacted Simpson but below is a phone log was sent by the engineer verifying the call.

Item 9: The engineers report does not satisfy my requirements and does not resolve the shear wall problem.

Item 12: The engineer states in #6 of his report that "the drywall within the primary structure appears to have been <u>installed</u> in an exceptionally well manner and appears to have a very high quality "finish plane" overall." The drywall in the bonus room was apparently completed by the homeowner and so would not be the contractor's responsibility.

Item 13: The engineer's report does not resolve this issue, it only gives the contractor a repair. Since this is a common issue, the contractor could us the engineers repair or a code repair to accomplish the same thing.

As Mr. Schnitzhofer is a Virginia licensed engineer and he placed his seal on his assessment, I found nothing in his report that would cause me to doubt his conclusions. I found his conclusions reasonable and in line with other reports I have seen thru the years.

Basically, after my review of the report, I found the report only fully resolved items 6, 8, and 12 of the corrections letter to the contractor.

Sincerely,

M.N. Wissingen

July 16, 2020

CERTIFIED MAIL

Hendricks & Son General Contractor, LLC 604 Hilltop Drive Staunton, VA 24401

Dear Mr. Hendricks:

On 6/10/20, 6/25/20 and 7/8/20 our office visited the Davis house, located at 1002 Round Hill School Road, to inspect concerns they have with the house you constructed under permit #718-2019. This house was constructed under the 2012 edition of the International Residential Code as amended by the Uniform Statewide Building Code. This letter is a report on our findings based on those inspections.

After review of the owner's concerns, inspections of those items, and inspections of the structures, I have concluded that the following items are not in compliance with the building code and need to be corrected:

- 1. The foundation on the detached garage does not comply with code sections R403.1.1 and R403.1.4.1.
- 2. Floor in detached garage is not sloping to the doors in accordance with section R309.1.
- 3. Sill plates in detached garage and house need anchor bolts within 12 inches of each sill plate splice in accordance with section R403.1.6. Need to correct to section R403.1.6 or provide an engineered design and approval in accordance with section R301.3.
- 4. Fascia trim on detached garage does not extend up behind the drip edge on the detached garage and the fascia is not protected per section R703.
- 5. Vinyl siding on detached garage and house not installed in accordance with the manufacturer's installation instructions.
- Some of the roof trusses are not installed in accordance to the manufacturer's specifications. An
 engineer will need to evaluate and design the necessary repairs and approve those repairs once
 made.
- 7. Back porch floor beams not properly anchored with appropriate hangers to band board of house. Second option is to provide post with proper connector to beam to an approved foundation. Third option is to provide engineered design and approval in accordance with section R301.1.3.
- 8. Floor joist are not all installed in the joist hangers to manufacturer's specifications. Need to correct to manufacturer's requirements or provide engineers design and approval in accordance with section R301.1.3.

Staunton (540) 245-5700

TOLL FREE NUMBERS From Deerfield (540) 939-4111 FAX (540) 245-5066 Waynesboro (540) 942-5113

- 9. Need an architect or engineer to evaluate, design and approve the walls of the attached and detached garage as shears walls per section R301.1.3 as these walls cannot meet the prescriptive requirements for wall bracing in the residential code.
- 10. Front stairs exceed allowed slope of 2 percent per section R311.7.7.
- 11. Provide manufacturer's installation instructions that PVC trim boards are installed in accordance with manufacturer's specifications. They show excessive uncontrolled expansion.
- 12. Per numerous photos of owner's taken after drywall finishing but before paint, the drywall was not secured in accordance with table R702.3.5. Need to correct to table R702.3.5 or provide an engineered design and approval in accordance with section R301.1.3.
- 13. Header at master bath toilet where floor joist was cut was not installed to code. Need to correct to R502.10 or provide engineered design and approval in accordance with section R301.1.3.
- Door in half bath in garage does not meet fire resistant requirements of R302.5.1. Need to replace with 1 3/8" solid core wood door, steel door or 20 minute fire door in accordance with section R302.5.1.
- 15. Grade to left of front stair needs to have proper grade in accordance with section R401.3 so that water will not pond behind sidewalk. (grade currently lower than sidewalk)
- 16. Dryer vent is installed in violation to section M1502.3 as it is within 3 feet of foundation vent which is a building opening. It needs to be rerouted to an approved location. Screws holding the duct together cannot protrude more than 1/8" into the duct. Duct cannot exceed 35 feet in equivalent length taking into account reductions for fittings in accordance with section M1502.4.4.1.
- 17. In addition we have been contacted by the owner that the attic access door is 22" X 22" instead of the 22" X 30" as required by section R807.1. You will need to check and correct if necessary.

Please contact our office within 14 days of receipt of this letter with a timetable to correct these violations.

Sincerely,

h.w. N.

S&A PROJECT ID:	20-081

REGARDING:

STRUCTURAL ASSESSMENT

Dear Jay:

A licensed structural engineer (P.E.) from Schnitzhofer & Associates, LLC (S&A) visited the residence located at the above listed location on September 29, 2020. The purpose of the site visit was to document the condition of the exposed, visible, in-place structural elements related to the following:

Primary House

Foyer Foundation Simpson Hanger Connection Roof Beam Overbuilt Trusses Roof Sheathing Plane Drywall Roof Truss at Front Bedroom Crawlspace Pier Location Joist Blocking at Crawlspace Plumbing Crawlspace Ventilation Anchor Bolt Spacing

Detached Garage

Garage Portal Frame

Concrete at Corner of Foundation

100

Dear Jay,

A licensed structural engineer for Schnitzhofer & Associates, LLC, further referred to as S&A, has visited the project jobsite, in the interest of addressing the potential framing issues presented to us. The purpose of our site visit and subsequent report is to provide our opinion regarding the acceptability of the visible structural foundation and framing element conditions present in the field.

Introduction

James R. Schnitzhofer, P.E. visited the home on September 29th 2020. Mr. Schnitzhofer was accompanied by Nate McConaughey, a licensed structural engineer from our Staunton branch. The owners of the property were also present. Mr. Schnitzhofer is an expert in structural consulting and has overseen 1500 structural engineering design projects throughout Virginia, and the "Valley". During his tenure at the head of Schnitzhofer & Associates, he has become intimately familiar with all aspects of local construction norms, standards of practice, standard of care, and construction craftsmanship. During the site visit completed recently, Mr. Schnitzhofer immediately noticed the high caliber construction that was in place. Generally, the quality of detail with regards to craftsmanship, and overall quality installation of the in place primary house framing and foundation systems, all appeared to be exceptional, compared to many counterpart contractors within this area.

Findings and Recommendations (Primary Residence)

1. Foyer Foundation

S&A Response: The front foyer framing appears to bear directly onto the CMU foundation wall. It is our understanding that this condition was inspected by, and approved by, the building inspector. Given the visible framing conditions present at the site, it is the opinion that this foundation system has been installed in general conformance with standard construction practice for this region.

2. Simpson Connections/Hangers At Floor Joists

S&A Response: The floor joists appear to adequately bear into the joist hanger seat. It is our understanding that this condition was inspected by, and approved by, the building inspector. The shear nails appear to be attached through the shear hanger fasteners holes, and potentially fall short of penetrating the supporting beam. In the interest of making a final determination regarding the adequacy of this connection, a licensed structural engineer from our firm contacted the technical/engineering division of Simpson Strong Tie. We discussed in detail the condition present at this location. Based upon the outcome of that conversation, it is our opinion that the connection is acceptable for safe and continued occupancy. For further clarification regarding this matter, we suggest that the owner contact a licensed structural engineer, in the interest of having them explain the material behavior and stress dynamics that Simpson uses for their load tables.

3. Roof Beam

S&A Response: The roof beam in question appears to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, we have determined that though a structural analysis of the subject beam, the beam is adequate to safely support the gravity loads at this location. From a construction standpoint, it is the opinion of S&A that the beam is installed in general conformance with the standard of care of this region.

4. Overbuilt Trusses

S&A Response: The overbuilt trusses in question appear to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, it is the opinion of S&A that the overbuilt trusses are installed in conformance with standard construction practice. In fact, the method in which the overbuilt trusses have been installed, is the method our firm recommends. In light of this, it is our opinion that this is not a structural issue.

5. Roof sheathing Plane at Overbuilt Trusses

S&A Response: The sheathing over the overbuilt trusses in question appear to be installed in general conformance with industry standards. It is our understanding that this condition was inspected by, and approved by, the building inspector. From a structural standpoint, it is the opinion of S&A that the sheathing at this area is installed in conformance with standard construction practice. It is very common that minor fluctuations within the roof sheathing plane occur with a complicated roof truss system such as the one present at this home. More specifically, it is our opinion that the roof sheathing installation is within generally acceptable tolerable limits for a framing project of this type.

6. Drywall - Bonus Room

S&A Response: It is our understanding that a majority of the drywall hanging installation at this area was completed by the homeowner – not the contractor. Generally speaking, drywall installation within pre-engineered bonus room truss web members is more complicated than installation onto a standard stick framed structure. As a result of the variations in roof truss profiles and anticipated movement/expansion/contraction of the truss web and chord members, it is generally understood that the anticipated likelihood of a perfect "finish plane" is very low. In light of this, it is the opinion of S&A that the drywall at this area is in a condition that one would expect for installation at the interior of the pre-engineered wood truss web members. The drywall within the primary structure, however, appears to have been installed in an exceptionally well manner, and appears to have a very high quality "finish plane" overall.

7. Roof Truss at Front Bedroom:

<u>S&A Response:</u>

While at the site, the homeowner indicated to our engineer that there was a potential problem with the truss bearing over the front bedroom. It is our understanding that this condition was inspected by, and approved by, the building inspector. However, it is our pinion that the homeowner misunderstood the behavior of pre-engineered trusses, and appears to have applied a faulty understanding of this condition. It is our opinion that the truss bearing does not occur as the homeowner suggested, and that the trusses within his area appear to have been installed correctly, and in accordance with generally accepted practice. Overall, we found that the roof system framing is in very good condition, and was installed in conformance with generally accepted construction practices for this area.

8. Crawlspace Pier

S&A Response: Based upon the assessment of the piers within the crawlspace, we found that the piers have been installed in conformance with generally accepted construction practices. It is our understanding that this condition was inspected by, and approved by, the building inspector. Additionally, based upon our assessment of the adjusted loading condition as a result of the 2" offset mentioned by the owner, it is our opinion that this condition is acceptable and is not in need of structural reinforcements.

9. Joist Blocking at Crawlspace Plumbing

S&A Response: It is common that alternate framing configurations are used in construction of this type. These are commonly referred to as "field adjustments". In this case it appears that the contractor supported the plumbing supporting joists with a standard "bulkhead" framing adjustment. It is our understanding that this condition was inspected by, and approved by, the building inspector. However, this minor framing adjustment could easily be strengthened by the installation of one new joist, immediately adjacent to the compromised joist. Given the circumstances, this repair would entail about \$50 in materials, and about 20 minutes to complete. A new Simpson face mount joist hanger could then support the cross member(s), 'bulkhead". Finally, this issue is extremely minor and, under no circumstances would this rise to the level of a legal dispute, or the idea that the contractor has provided work that is not in conformance with the standard of care of this area. Additionally, this does not indicate that the structure is "unsafe".

10. Crawlspace Ventilation

S&A Response: Based upon our calculations, Schnitzhofer and Associates, LLC found that the crawl space ventilation area provided does exceed the required area. We recommend review by the building official, in the interest of approving the removal of the vent adjacent to the dryer vent. Specifically, the building official will need to approve the removal of a vent within 3 feet of a building corner.

Davis Residence: Structural Assessment 11.03.2020 51P a g e

11. Anchor Rods

S&A Response: Based upon our assessment, Schnitzhofer and Associates, LLC found that the anchor rods are spaced as needed to satisfy the spacing requirements within the building code. However, there may be the need for additional anchors to be installed at the locations where the sill terminates. This operation is relatively easy and cost effective to accomplish. It is our understanding that this condition was inspected and approved by the building department. However, if you are in need of this reinforcement design, please contact S&A and we will prepare a quote for the retro-fit anchor installation specifications.

Findings and Recommendations (Detached Garage)

12. Braced Frame/Portal Frame at Garage Doors

S&A Response: It is the understanding of S&A that the garage portal frames have been installed as directed by the building inspector, have been inspected, and ultimately approved by the County. However, we understand that the inspector now believes the framing is inadequate. In light of this, we believe that, by the introduction of additional shear wall length (Approximately 4 feet), new hold down anchors, and minor foundation reinforcement, the portal wall can be reinforced to adequately support the anticipated lateral loads. Specifically, we suggest the removal of the 10 ft x 10 ft doors, installation of two new, 2 foot braced walls in each bay, removing and infilling the man door, then replace the existing garage doors with new doors to fit the adjusted openings. This work would be completed in conjunction with foundation reinforcements as needed to provide adequate anchorage for load path to foundation continuity, in the interest of resisting overturning forces present in the shear walls. Contact S&A for a design of the final braced wall and foundation reinforcement specifications, if needed.

13. Concrete at Corner of Foundation

S&A Response: It is the understanding of S&A that the corner of the garage foundation has been exposed to reveal the slab edge. During the time of the site visit, approximately 2-3 feet of the turn down slab foundation was exposed. If the frost depth needs to be met at this location, we suggest pouring additional concrete at this area, to comply with the local building department frost depth requirements. This is a very easy solution to this condition. We have not reviewed or commented on any foundations that were not exposed during the time of the site visit.

Davis Residence: Structural Assessment 11.03.2020 61Page

Executive Summary

A licensed structural engineer from Schnitzhofer & Associates, LLC visited the home and completed a visual assessment of the in-place framing within the interior of the primary home, including the bonus room and the attic framing area. Based upon our many years of review of residential construction in this area, other than the minor recommendations for framing adjustments listed above, we have found that the overall framing we were asked to review within the primary home is in conformance with generally accepted construction practices for this area. Additionally, we believe that workmanship represents an appreciation for the standard of care one would expect under the conditions present of this home.

LIMITATIONS

While Schnitzhofer & Associates, LLC has completed a visual assessment of the above listed items, we were not provided the photographs shown to our staff during the site visit. A review of these photographs would be beneficial to resolving the framing questions posed by the owner. If you would like us to comment on the framing that is covered up, we suggest providing our engineers with the photographs showing the areas in question. Otherwise, it may be useful for the home occupants to demo the interior finishes where they believe a structural framing issue exists, and have their engineer review these framing elements. If their engineer then believes that there is a framing deficiency, then they could forward those findings to you for additional review. Overall, it is our understanding that neither the building official, our engineer, nor any other engineer, has found a framing issue within the roof framing viewed by our staff while inspecting the attic framing during the site visit, and, as such, it is logical to assume that demolishing the drywall is not warranted at this time. Generally, there would need to be significantly more damage to the interior finishes, for an engineer to believe there is a structural defect in the overall framing system. Currently, the evidence of a framing deficiency is not visible. We have only completed an assessment of the items in question listed above. We are happy to provide a full structural analysis of the home. However, based upon our assessment while at the site, we don't feel this is necessary. Should you be in need in of a full analysis of the home, please contact us and we will prepare a proposal for services.

Schnitzhofer & Associates, LLC are happy to provide this structural assessment report with regards to the project located in Crimora, VA. Please feel free to softeet us at 540-448-8321 at any time to discuss this structural report.

Sincerely,

James Ray Schnitzhofer P.E. President

RE: DEFAMATION

CERIFIED US MAIL

Hello Michael and Monica,

Please allow this letter to convey our serious concerns with regards to your statements regarding our firm.

It has been brought to the attention of Schnitzhofer & Associates, LLC, the following:

- 1. Michael and Monica have stated that "Schnitzhofer And Associates, LLC is not licensed".
- 2. Michael and Monica have stated that, "Schnitzhofer And Associates, LLC is not insured".

Be advised that your statements are untrue now, and were untrue at the time they were uttered.

In addition to potentially defaming Schnitzhofer & Associates, LLC, you unnecessarily and improperly communicated these statements to multiple third parties. Schnitzhofer & Associates, LLC has a good working relationship with these third parties and, as such, your statement could potentially damage the long-standing positive reputation within the community in which we operate. We have obtained the names of those third parties and plan to notify them of your false statements.

If you continue to make such statements, we will consider legal actions and remedies that are available to Schnitzhofer & Associates, LLC, due to your knowingly defaming comments.

Sincerely,

James Ray Schnitzhofer P.E. President

Building Board of Appeals Appeals Hearing, Michael & Monica Davis December 15, 2020, 8:30 a.m. Clean Transcript

Members Present:

Bill Dudley, *Acting Chairman* John Earhart Pat Katz David Kirby Attendees:

Jay Hendricks Zuzanna Loar

Staff Present:

G.W. Wiseman Renee Southers

G.W. Wiseman:

Mr. Seaman has to be tested for COVID, so I'll call the meeting to order. The first order on the agenda since Mr. Seaman is not here and he's the Chairman, is for you all to vote on the Acting Chairman for this meeting.

David Kirby:

I nominate Mr. Dudley.

Pat Katz:

Second.

The motion carried and passed unanimously.

Bill Dudley:

Okay, with that being said, bear with me. I guess you're here to appeal the engineer's decision on this, is that where we're at?

Michael Davis:

Yes sir.

Bill Dudley:

Ok, go ahead.

Monica Davis:

So, basically the letter that G.W. initially did stated that analysis would need to be run and a new direction and design in reference to the structure's current state, and the beams being in the wrong location, the trusses being 26 inches on center and even some missing. The report that Mr. Schnitzhofer did, when he came, one of the first things he stated when he got on site was he is being paid for one hour and that is it, so we need to hit the high stuff. There is no high stuff. It's all important to us, regardless if it was to him or not. If you note, every item that he inspected he only did a visual inspection and everything says that it was approved by the building inspector, which is not true because that's why they were cited, that's why the items were being addressed because--

Bill Dudley:

I did notice that in each statement--

Monica Davis:

Every statement says it in the second line, it just reiterates itself. Everything was only visually inspected. There was no analysis run. All he did was do the same thing Mr. Wiseman did. He looked at it. That

1

wasn't the whole purpose. We were not under the impression that was the purpose of the engineer to come. It says, per GW's certified letter, that you need to come out and analyze the current status of the structure and determine if what's there is capable of staying in place and being adequate for the weight that the walls are bearing and that the whole change of the design. That never took place. No drywall was ever penetrated. All he did was look at what is there and you can't see. You can't see that the LVL beam is in the ceiling, that belongs in the floor. You can't see that. When we went up to the attic, he did measure the 26 inches on center and noted that but he never reached out I mean, he had to truss design but there was no analysis run to determine that it is okay. It is not okay and it clearly says it on the truss design, that is 26 inches on center. If that house was designed for that, that needed to be stuck to and if it wasn't then you needed to show how you got to the determination that it is okay. One individual of a professional can't look at it and say that it's good and another one look at it and say it's not okay, one good one bad, that's not how it works. You have to say, okay, I looked at it, I've deemed it to be okay because of this. Otherwise you just have two professional individuals, one says it's right, one says it's wrong.

Michael Davis:

One guy saying it's wrong by the code, we've got another guy saying well in my opinion is right. **Bill Dudley:**

Well the inspection is basically visual anyway. Now your calculations would be up to the--

Monica Davis:

Up to the engineer, right.

Bill Dudley:

--to the engineer.

Monica Dudley:

Right, which is what we determined was going to happen because it says analysis and new design would need to be put in place with the current structure, change of design that was done. I mean, you can't tell me that a 2x10 that's in the location that a LVL beam is supposed to be a double ply that's 16 feet long, you can put a 2x10 and it's right. You can't do that. Those beams are designed to hold the weight. That's why they are put in the locations they are supposed to be and we have one that's in the ceiling that belongs in the floor. I did a conference call with Dave from Mid Atlantic which is the company that did our truss design and put their stamp of approval on it for the way it's supposed to be constructed. I did a conference call sitting in my attic. He said put your hand on the one on the left, and I did, put your hand on the one on the right, it doesn't exist. There's a 2x10 in there. He said you have a problem. So we're looking for someone to do exactly what we thought was supposed to take place to repair it because anybody in the building industry knows if a LVL beam belongs there it's bearing weight, it has a purpose and a 2x10 is not going to do what that beam is designed to do.

Bill Dudley:

So, you're contesting the whole engineering report?

Monica Davis:

That's correct because every item clearly says that it was an opinion, and that all of the items were passed by the County, and they were not.

Michael Davis:

A prime example, let's just go down to the detached garage where it was dug up on the corner to show that there is no turn down on the slab. Mr. Wiseman noted that himself and said that is a problem and
the engineer just said pour some concrete in the hole. That's not how we fix it. The floor is busted 10 ways from Sunday, it's shifting, it's moving. It's almost becoming a trip hazard. So something's not right. **Monica Davis:**

And pouring concrete in the hole that's exposed is not the answer.

Michael Davis:

For the floor joists you've got one-inch nails in the Simpson hangers, inch and a half nails where it's supposed to be three-inch nails. These are all things that Mr. Wiseman noted and said they were a problem and this guy comes in and just looks around and says well it all looks good to me.

Monica Davis:

So, I provided the documentation that was sent to me from Simpson because I have been in contact with them several times. One of the very first things, and the attachments that you see were sent directly from their senior engineer along with the email that says, look, it's wrong, your nails that are in place right now don't even penetrate your header, and they don't. You can get under my house, and all of the hangers, there's two problems. Number one the gap is twice the allowable, which states on the paper you can't have that. On top of the gap being too big, it has a one-and-a-half-inch nail that doesn't even penetrate the board so when you shine a light up in there because you can because the gap is so big, my nails don't even penetrate the headboard. My floor joist is literally sitting in these hangers that the gaps too big. And we had a company come out and look at the floor joist, JES, and said the floor is already sagging because the joists, that the hangers are wrong, eventually that's going to happen because the weight is not in the hanger like it's supposed to be. It's going to continue to drop. And there's no support for the nails so it's just sitting there.

John Earhart:

Where are you talking about those nails going into the Simpson hangers? What type of beam is that going in to?

Monica Davis:

It's going into an LVL beam but it doesn't even go in. Like it doesn't even penetrate the board. When you shine your light--

John Earhart:

Don't we always use inch and a half nails on Simpson hangers?

G.W. Wiseman:

You have two sets of nails on these hangers. You've got face nails to the LVL--

[cross talk] (8:07)

--you've got face nails to the floor joist and then there's a pair of cross nails in the back. One pair of cross nails in the back.

Monica Davis:

They're called double--

John Earhart:

I'm talking to him right now.

Monica Davis:

Sorry.

John Earhart:

Give me just a minute. But are the inch and a half nails the ones that are going in on the face of the joist hangers?

G.W. Wiseman:

The face nails are an inch and a half. The others are three.

John Earhart:

Is that not sufficient?

Bill Dudley:

I think we're talking about the cross nails.

G.W. Wiseman:

The cross nails are the ones that they are questioning.

[cross talk] (8:43)

John Earhart:

But the inch and a half are the ones we've used for 30 years?

G.W. Wiseman:

Correct. And they are still used.

John Earhart:

So, the only question we've got is the cross nails?

G.W. Wiseman:

Correct.

David Kirby:

Were the joists nailed in by hand or nail gun?

G.W. Wiseman:

I do not recall. Simpson actually allows both.

John Earhart:

Yes. Doesn't make any difference.

G.W. Wiseman:

Simpson will allow it to be done with a nail gun or by hand. It used to be nail gun.

[cross talk] (9:14)

David Kirby:

Were they nailed in or were they just resting in the hanger?

G.W. Wiseman:

No, they have nails on them. The whole issue is the cross nails.

John Earhart:

Can you get back in there to do cross nails or not?

G.W. Wiseman:

You could pull the nails that's in there out and put the others in but in his report, it says "the floor joists appear to adequately bear on the joist hanger seat. It is our understanding that this condition was inspected by and approved by the building inspector. The shear nails," which are those two nails, "appear to be attached to the shear hanger bracket holes and potentially fall short of penetrating the support beam." He states that. "In the interest of making final determination regarding the adequacy of this connection, a licensed structural engineer from our firm contacted the technical engineering division of Simpson Strong Tie. We discussed in detail the condition present at this location. Based upon the outcome of that conversation, it is our opinion that the connection is acceptable for safe and continued occupancy."

John Earhart:

They are acceptable? G.W. Wiseman: It says "it is our opinion that the connection is acceptable for safe and continued occupancy." **John Earhart:**

And that came from Simpson?

G.W. Wiseman:

No, that came from the engineer after he talked to the Simpson technical engineering division. John Earhart:

Right.

Bill Dudley:

Who hired the engineer?

Michael Davis:

Mr. Hendricks did, but in regard to what he just said, you can contact Simpson and they keep email documentation of everybody they talk to. Nobody from Simpson has talked to Mr. Schnitzhofer.

Monica Davis:

I talked to Mr. Bundy, who is the senior engineer for the northeast. There's an email in there. I spoke with him and he said you know, we always direct people to go to the literature because the literature clearly indicates what's acceptable and what's not. As my husband stated, when an individual from an engineer firm calls they log it, and they email because they want to make sure that the direction that they're giving is not debatable. It's not like we're doing right now where an individual says they called and give direction and then you have a report saying that they spoke to them. That's not the case. Even if the individual called from Mr. Schnitzhofer's engineer firm and did not indicate that he was from an engineer firm and that he was looking for guidance and direction. If you look at the literature, which the email came from Mr. Bundy himself. Here's the literature saying look, it's not acceptable, it clearly states it. The double shear nails are not acceptable. On top of that, you have twice the allowable gap so you have two problems going on in one location.

John Earhart:

Okay, so what are you trying to do? Get the contractor to come back and pull those nails? **Monica Davis:**

No.

Michael Davis: The joists aren't long enough. Monica Davis: The joists aren't long enough. John Earhart: The what? Monica Davis: For the hangers. John Earhart: Are they the wrong hangers?

Monica Davis:

No, the hangers are correct for the application but now that the gaps are twice the allowable, they're not. The whole hanger needs to be changed. If you look at the documentation from Simpson it says it can't be any bigger than an eighth, and I have twice that. So there's two problems going on in that location. You have a gap that's too big and it can be fixed with a different hanger. So the hanger that's there for all the ones that the gap is twice the allowable, those hangers have to come out and new

hangers have to be put in so that the leg that comes off the bottom is longer. But either way, the pictures clearly show on the documentation that Mr. Bundy, the senior engineer sent me, I mean I've attached the email--

John Earhart:

Has that spread since your inspection?

G.W. Wiseman:

I don't know, I haven't been back out there since the initial inspection. In my letter, if you pull the second attachment sheet from the back, in your packet--

John Earhart:

Second sheet from the back?

G.W. Wiseman:

--the second attachment from the back. Take a clip off the top. The last thing in your packet is Mr. Schnitzhofer's engineering. The thing before that is the correction letter to Mr. Hendricks. Item Number Eight says floor joists are not installed in the joist hangers to manufacturer's specifications. Need to correct to manufacturer's requirement or provide engineer's design and approval in accordance with section R301.1.3. R301.1.3 Engineers Design. That is building code. When a building or otherwise conventional construction contains structural elements exceeding the limits set forth in R301, or otherwise not conforming to these codes these elements shall be designed in accordance with acceptable engineering practice. The extent of this design need only demonstrate compliance of nonconventional elements with other applicable provisions, and should be compatible with performance of a conventional framing system. Engineered design in accordance with International Building Code is permitted for all buildings and structures and parts thereof, including the scope of this code. My interpretation of Mr. Schnitzhofer's letter was he was not saying that it met Simpson's standards. He was saying that based on his analysis, it is acceptable. Which, as Ms. Katz knows, she's an architect, an architect or an engineer can often design something that is not to the manufacturer's specs, but it's designed according to acceptable engineering.

Pat Katz:

Right.

John Earhart:

Right.

G.W. Wiseman:

Which is why I think it is in compliance. Mr. Schnitzhofer is a licensed engineer and he sealed the drawing in the back.

Monica Davis:

How can you say that something that's supposed to be a nail, that's supposed to be holding something in place that doesn't even penetrate the board, like it's supposed to, how can you say that is okay? Otherwise it's just sitting there.

David Kirby:

At this point this engineer has pretty much just wrote you an insurance policy. He says it's okay and he kind of overrules us so if he says it's ok.

Monica Davis: Right... Michael Davis: So it's all on him now? **David Kirby:** It's on him now. John Earhart: That's the way I see it. **Michael Davis:** Alright. Monica Davis: Yeah, but it says it's his visual. Michael Davis: I'm not going to argue about it. David Kirby: He's got his stamp--John Earhart: He's got a stamp. **Monica Davis:** Well if you look and you run his license, actually he is not a licensed engineer because you cannot validate his license. John Earhart: He's got a stamp, that's good enough for me. G.W. Wiseman: He's got a stamp and his license does show on DPOR but it says that they are not updating licenses right now because of COVID. John Earhart: Because of what now? G.W. Wiseman: DPOR is not updating licenses right now because of COVID. John Earhart: Oh okay. **Michael Davis:** They're updating building licenses. John Earhart: Well, he's got a stamp what can I say, I can't overrule him. **Monica Davis:** Okay. **Michael Davis:** Alright. **Bill Dudley:** What do you have to say about this G.W.? G.W. Wiseman: I read Mr. Schnitzhofer's entire report. He does not sign off on everything in this house. There are things such as anchor bolts where he says anchor bolts may need to be added and that those anchor bolts need to be added. Mr. Hendricks is to get with him regarding the design for adding those anchor bolts. The foundation on the garage where the foundation was missing. He says that they need to dig it down

the frost line and then pour from the frost line up to the bottom of the slab. Again, that's not an

7

uncommon occurrence, it's done all the time, and he sealed the design. So, my issue with it was Mr. Schnitzhofer is a licensed engineer, I thought the report said, what is typically said in a lot of engineering that I look at. I didn't see anything that stuck out that said this is wrong. If the Davis's wish to hire another engineer, they are certainly welcome to do that. No one is stopping them from doing that. But at that point if they then want to determine who's engineering we're going to go by is a civil matter. They need to let a judge decide that.

John Earhart:

That's the way I see it. I don't see nothing else we can do. We can't override an engineer.

Bill Dudley:

That is exactly what I think, we're not engineers.

John Earhart:

We can't do that. We don't have the authority to do that.

Bill Dudley:

We're building professionals, but we're not engineers.

David Kirby:

Mrs. Davis mentioned trusses 26 inch on center, couple of trusses missing, LVL beam in the wrong place, I haven't seen that in the engineer's report or anywhere else.

G.W. Wiseman:

He evaluated the beam, he evaluated the trusses--

Michael Davis:

How did he evaluate the beam when he didn't even see it?

G.W. Wiseman:

He said "the roof beam in question appears to be installed in general performance with industry standards. It is our understanding that it was inspected and approved by the building inspector. From a structural standpoint, we have determined that through a structural analysis of a subject beam, the beam is adequate to safely support the gravity loads of this location."

Michael Davis:

The beam is not there.

G.W. Wiseman:

He's saying it's adequate, so what do you want me to do?

Monica Davis:

He didn't see it. He didn't penetrate the wall, when he come into our home he seen the same thing...

John Earhart:

If he were to penetrate the wall and found it to be okay then who pays for that penetration to put it back?

Monica Davis:

I didn't put the beam in the wrong place.

Michael Davis:

I don't have a beam.

Monica Davis:

I don't have a beam, it doesn't exist.

Michael Davis:

I have 2x10's where a beam is supposed to be. That's supposed to support the floor load of an upstairs floor over top the rest of my house.

Bill Dudley: Did the engineer see that? **Monica Davis:** No sir, he could not see it. **Michael Davis:** There's drywall, you can't see it. **Monica Davis:** So how can you tell me it's ok if you can't see it? Michael Davis: So this beam here--Bill Dudley: So how do you know that is what's in there if you can't--Monica Davis: Pictures. Michael Davis: Because I have pictures. **Bill Dudley:** Did you show the engineer those? Michael Davis: I showed him the picture of the 2x10 up there. **Bill Dudley:** What was his comment on that? Michael Davis: That's not right. That's exactly what he told me standing in my garage. John Earhart: Then why isn't it in his report? **Michael Davis:** I have no idea. He wanted to know about, if we could give him pictures and due to the legal battle, I can't hand him anything--**Monica Davis:** I would have loved to. Michael Davis: --without my lawyer and Jay's lawyers' permission. **Monica Davis:** We have walls that are 12-foot-tall with a second story--John Earhart: Well the only thing I can tell you is we can't override an engineer. **Michael Davis:** Okay. **Monica Davis:** Okay. **David Kirby:** I don't think we have that authority. John Earhart:

I know we don't, do we?

Monica Davis:

You do.

Bill Dudley:

I don't believe we do.

Pat Katz:

Well technically--

Bill Dudley:

Would you like to have it re-engineered? Have a different engineer come in?

Monica Davis:

We started that process with Engineer Solutions--

Michael Davis:

There's a proposal in here.

Monica Davis:

--there's a proposal in there with what needs to take place to determine if the structure is sound or not and how to repair the problems that currently--

John Earhart:

Are you going to hire an engineer to--

Monica Davis:

I'm not hiring him. I paid \$362,000 for this home to be put in place and done proper, I shouldn't have to spend another \$10,000 to determine if what I've got is okay.

Pat Katz:

But this report is basically saying--

Monica Davis:

No, ma'am, it's not saying that. It's saying from his visual inspection and his opinion. I didn't ask for his opinion, I asked for his analysis.

Pat Katz:

His stamp says that.

Monica Davis:

Okay.

John Earhart:

His stamp stays that. Aren't there four things in there he wanted corrected?

G.W. Wiseman:

There are four things he wanted corrected.

[cross talk] (20:44)

John Earhart:

If they're done, then I'm done.

Michael Davis:

May I ask a question? So, in this man's report for my garage it says to remove my 10-foot doors and downsize and remove my man door, how are you going to get into the garage?

G.W. Wiseman:

If you do not wish to have that done--

Michael Davis:

How are you going to get in that garage if you take that man door out?

G.W. Wiseman:

If you do not wish to have it done that way that is absolutely your right.

John Earhart:

That's right.

[cross talk] (21:10)

G.W. Wiseman:

That is an issue between you and the general contractor.

Michael Davis:

Okay, fair enough. We can we expect all this stuff for--

G.W. Wiseman:

It's going to be at least a month.

Michael Davis:

Okay.

Bill Dudley:

So, what all have we agreed that we're going to repair?

G.W. Wiseman:

He still has to repair the anchor bolts. He's got to repair the foundation. He's got to deal with the wall bracing. He's got to deal with the floor joist, he's got to add a floor joist--

Bill Dudley:

Does he have to pull those nails where they are too short?

G.W. Wiseman:

Schnitzhofer said that it was--

John Earhart:

That's not what the engineer said.

[cross talk] (21:47)

Bill Dudley:

He said it was fine?

G.W. Wiseman:

He said it was adequate the way it was for safe and continued use.

David Kirby:

If the engineer said it's ok, that's good enough for me.

G.W. Wiseman:

He said it was adequate for safe and continued use.

David Kirby:

If you're really concerned about the beam, you may have to yourself, cut out a little bit of drywall so some engineer or someone could see it.

Monica Davis:

Right, which is part of the proposal in there from Engineer Solutions that says this is what needs to take place to determine what the proper analysis and repairs that need to take place. Which was what our request was, to say look, we started this process with an engineer. We've done the legwork. This is what needs to take place to determine how the repairs need to take place for the current structure.

Michael Davis:

When a man gets out of his car and the first words out of his mouth is I've only been paid for an hour, then I know he's not there for my help. He's not there to truly do what he's there to do. He's looking at

the hour he's been paid for and he's got to go. That's what he said when he got out of the car. So, all he did was walk around and look, he didn't do nothing.

John Earhart:

The contractor hired the engineer?

Michael Davis:

Yes sir.

G.W. Wiseman:

The contractor hired the engineer based on--

John Earhart:

If I've got a problem with whatever, my truck or whatever it is, I'm the one that's got to prove it's wrong. Not Ford Motor Company.

G.W. Wiseman:

Correct.

John Earhart:

So I'm going to hire whoever I have to hire, lawyers, engineers to prove that this is wrong. And then it becomes a civil between me and Ford. Or between me and my contractor.

G.W. Wiseman:

Correct.

John Earhart:

So, for what we got to go on, we cannot override this engineer.

Bill Dudley:

Right.

Pat Katz:

Right.

John Earhart:

As long as the contractor agrees to do the things that the contractor's engineer said to do.

Bill Dudley:

It would be up to you all to hire someone else to say--

John Earhart:

Exactly, you're the one that has to prove it.

Bill Dudley:

--that's wrong.

Monica Davis:

So, when I hire an engineer and he says that this is wrong and I come back in here and you say, this is what we said. Well it's that guys word against yours.

John Earhart:

It's a civil matter.

G.W. Wiseman:

It's a civil matter.

[cross talk] (24:10)

John Earhart:

It's a civil suit between you and the contractor or whoever.

G.W. Wiseman:

It's a civil suit to be settled by a judge at that point.

Monica Davis:

Sure, let's just finish.

Michael Davis:

So, who takes care of the end that the County didn't withhold as far as letting all this stuff go and not catching it through the building process. So if my County guy comes out to inspect my house, and he's got my truss design right here in his hand and literally all he's got to do is walk through and look at the numbers and say yeah, they're all there, who holds that man responsible for the fact that there's a whole truss missing on one end of my house and on the other end of my house that's holding the second story there's a LVL beam completely gone. Who holds them responsible?

G.W. Wiseman:

Where's the paperwork that says it's missing?

Michael Davis:

You can get in there and see. You saw it yourself.

Monica Davis:

We showed you.

Michael Davis:

You were upstairs.

G.W. Wiseman:

You showed me a truss that appeared to be a 2x10 instead of an LVL.

Michael Davis:

I showed you a truss design. I'm not going to argue. You got the same truss design I got. You know what's there and what's not.

G.W. Wiseman:

And I saw no missing trusses.

Michael Davis:

Yeah. Okay, sure. Fine.

Monica Davis:

What about the beam? What about the LVL beam that was clearly missing?

G.W. Wiseman:

The beam, there was a 2x that was sitting on top of the LVL, which is what I questioned. He has answered that question.

Monica Davis:

Okay.

Michael Davis:

There's no LVL in that second location.

Monica Davis:

There's no beam there.

G.W. Wiseman:

He's telling me the beam that's there is adequate for the loads imposed.

[cross talk] (25:34)

Monica Davis:

Let's just get it over with. Our care is at the state level which is really sad that the County, you have no--

Michael Davis:

I'm sorry I built in this County.

John Earhart:

I'm sorry you're having trouble, I really, truly am. Your home is most people's largest expense. They spend their whole life--

Michael Davis:

It is. This is my forever home that I built on the hill and now it's a disaster.

John Earhart:

And I understand that.

Michael Davis:

I'm looking at anywhere between \$100 to \$150,000 to correct the issues.

John Earhart:

I still think that it's going to end up being a civil suit, if that's what you want to do, if you think it's going to fall down or whatever. I don't see where we can override, in any shape or form an engineer, I don't think we have that authority to do that.

G.W. Wiseman:

I certainly don't.

John Earhart:

And I think probably what needs to be corrected, is what the contractor's engineers stated, I think those four things I believe.

Bill Dudley:

I would offer that you may, if you are not liking the decisions you're getting from us go to the Board of Contractors.

Michael Davis:

I'm going to the state level.

Bill Dudley:

That's what I'm speaking of. The Board of Contractors in Richmond. Because we pay a fee for people that default on property. That fee goes to pay the people back for the problem that they have and then the contractor loses his license until he pays that money back.

Michael Davis:

Yes sir.

Bill Dudley:

Contractor's recovery fund. That's through the Board of Contractors. To me, that would be my next step I would go to and then it becomes between you all and the Board and the contractor, that it takes us out of it at the local level and takes you to the state level.

John Earhart:

But you are still, even when you go there, going to have to prove your case.

Michael Davis:

I understand that.

Monica Davis:

Right.

John Earhart:

It's not going to be your word at all. It's going to be, you're going to have to--

Monica Davis:

The facts.

John Earhart:

--have that stamp.

Michael Davis:

I'll get that stamp taken care of.

John Earhart:

And then it's going to become a civil suit.

Monica Davis:

Mr. Jeff Brown is at the state level and Travis Looter, which have been phenomenal, they have been very good guidance and direction and pointing me in the direction to go but this is a part of the process that you have to do first. We were just hoping that you would consider the information that was provided from two different engineers saying how did he determine this was good when this is what actually had to take place. That was all we were looking at.

John Earhart:

We looked at, but we can't do anything.

G.W. Wiseman:

Basically, you submitted a proposal you didn't submit engineering.

Monica Davis:

Right, a proposal that needs to take place to determine if the structure was good or not. That's it, let's just move on.

John Earhart:

Our hands are tied.

G.W. Wiseman:

Even if we had the other engineering, it's a dispute between one engineer and another and it's still going be a civil matter. I can't make that decision.

John Earhart:

No.

Bill Dudley:

I guess you could get a third engineer and they could split it.

John Earhart:

And that happens.

Bill Dudley:

If two agree, you know, maybe.

John Earhart:

What usually happens is you would get an engineer, the contractor gets an engineer, and those two engineers pick a third engineer between the two, they'll pick a third. I mean it may go that far.

Michael Davis:

Well I'm going to pay for mine, I'm not going to pay for another.

John Earhart:

But you know what I'm saying? Those two will pick another one then whoever wins, wins at that point. **Bill Dudley**:

And then at that point, if you could arrange such a meeting I'd recommend that GW be a part of it to so that he can defend himself on the spot.

Monica Davis:

We'll just deal with it from the state level, we appreciate your time.

John Earhart:

I don't know what else we can do.

David Kirby:

Once you get an engineer to say something, it overrules us. And if you had an engineer and he came in and said something else, you know, we couldn't argue with him either.

John Earhart:

Yeah, I mean even if you would have brought your engineering here today we couldn't have--

David Kirby:

If he said it wasn't and this guy said it was, that's beyond us, we can't make that decision really.

G. W. Wiseman:

And we don't have the authority to tell a contractor, I can't tell Mr. Earhart if he's got a problem then he has to hire Ms. Katz to fix it. I don't have that authority.

Bill Dudley:

Well do I have a motion that we adjourn this meeting.

G.W. Wiseman:

You need to vote on whether you're going to uphold my decision to accept the engineer report or not. **David Kirby**:

I move that we uphold the Building Official's decision to accept the engineer's report.

Bill Dudley:

I second.

The board voted to unanimously to accept the engineer's report and the meeting was adjourned.

Additional Documents Submitted by Monica and Michael Davis

(Page left blank intentionally)

Third Submittal

Below you will find clarification in reference to number 6 on the engineers report from Schnitzhofer. It was stated the majority of the bonus room was hung by the homeowner. Just to clarify my husband hung 12 sheets in that room out of almost 4 sheets total. Below are images that will show that the sheets he hung were hung to code verses the sheets the contractor hung.

Here is more sage in the ceiling do to the improper install

You will also find in the attachment an engineer's report from Brian Koerner with Engineer Solutions. We were told at the county appeals we would have to prove that what we were saying in reference to the truss design not being installed proper because the report from Schnitzhofer under numbers 3, 4, 5 and 7 that the truss system is adequate to support, installed in conformation with standard construction practices, and that what the homeowner actually misunderstood the behavior of the trusses and goes as far to say what the homeowner actually see is not occurring. I am attaching additional images that go along with what our engineer calls out in his report. Below are images of the improper gap for hanger installs, as well as hangers with no hardware, hangers with the wrong hardware, LVL beam in the celling, 2x10 in the place of the LVL Beam, and trusses setting on interior walls. PLEASE BE AWARE EVERY HANGER THAT WAS EXPOSED WAS WRONG RATHER IT WAS HARDWARE, NO HARDWARE, GAP TO LARGE, OR NO HANGER AT ALL

Image taken by Monica Davis 4/1/2021 VERY BAD gap in hager to wood of truss is over an inch wide

.com Subject: Site Visit Summary – February 25, 2021

Ms. Davis,

This is a summary of the site visit provided on February 25, 2021 in regards to several ongoing issues at your recently constructed house. There are several items that do not meet the building code and need to be fixed immediately to avoid future, long term issues.

The Detached Garage

The building code is really clear on all footings need to be below frost depth. The garage footings do not meet frost depth at any of the four corners and likely all the points in between the corners along the walls. Before any work is to be done, we would appreciate the opportunity to review the proposed repair by any contractor. The proposed repair should be presented in a drawing, sealed by a Professional Engineer licensed in the Commonwealth of Virginia.

ES. 1120-677

ESCM No. 1120-677 Davis Residence March 8, 2021 Page 2 of 5

The Bonus Room

Upstairs in the Bonus Room, the framing does not appear to be consistent with the framing plan provided by the truss manufacturer. A section of drywall was removed in order for Engineering Solutions to evaluate the roof framing. An LVL beam, as shown in the picture to the right, was discovered in the roof framing that is not in the framing plan that was approved by the Augusta County Building Department. The Builder will need to provide an updated drawing sealed by a licensed Professional Engineer showing this field revision.

For the USP THD hanger that supports this LVL, the wrong nails were used. As indicated by the ESR3445 attached, the only nails approved by the ESR is 16d Common for the header nails as shown in Table 8 of the ESR on page 13. It is very clear in the picture that the nails into the header are not 16d nails. A picture of the installed nails is shown in the picture to the right.

As stated in ESR-3445's Section 3.0 Conditions of Use on page 24, the "supported end of joist of beam must be within ¼-inch from the supporting member." Based on our field measurements, the end is over the ¼" maximum measurement. A repair provided by USP and sealed by a professional engineer must be provided. Using a hanger outside of the ESR testing is not advised. This is

not the only scenario where the end gap is over ¹/₄". It is EXTREMELY important that all hangers are installed properly. In our professional opinion, all hangers will need to be reviewed by a representative of USP and a proposed repair be developed by the hanger manufacturer. Once the repair plan has been developed, the field repairs should be evaluated by a licensed Professional Engineer.

ESCM No. 1120-677 Davis Residence March 8, 2021 Page 3 of 5

The Attached Garage

There are several areas where the gap appears to be non-conforming with the joist hanger manufacturer's specifications. The gap is over a half inch in some locations. As previously mentioned in this report on Page 2, the maximum end gap is $\frac{1}{4}$ ". Two such examples are shown on this page.

The tall 2x4 framed garage walls supporting a second floor should be checked for load capacity in combined axial and bending. With a wind load applied and 40 pounds per square foot live load in the bonus room above and snow load, it does not appear that the 2x4 framed walls are adequate, which could lead to a catastrophic wall failure.

Additional areas of the wall may need to be opened up if fire blocking is greater than 10' from the sill. Based on the picture provided by the homeowner, it appears that the fire blocking may not meet code.

A section of drywall in the attached garage was removed. After opening up the area, the framing is not consistent with the approved building plans. 2x10 lumber was observed where an LVL beam was supposed to be.

ESCM No. 1120-677 Davis Residence March 8, 2021 Page 4 of 5

The Foundation Walls

The foundation walls continue to crack. In some spots, you can see daylight through the mortar joints. In other locations, there are mortar joints that do not meet the ACI Code specifications.

Intersecting foundation walls are not tied into each other. Differential settlement has occurred and a gap has opened up between the two non-connected walls.

Hangers

The nails used for the LUS210 hanger are to be 10d nails. Based on the Simpson Strong-Tie website, the shorter Simpson nails may not be used as double shear nails. This website page print is attached to this report. Simpson should be contacted to provide a recommended repair sealed by a Professional Engineer.

As noted earlier, some connections have too large of a gap between the face of the main member and the end of the wood member supported by the wood hanger.

In other scenarios, there are gaps between the bottom of the floor joist and the hanger. There are multiple examples of this. The floor joists will continue to move and make noises as they are not supported properly. The joist hanger manufacturer should provide a repair sealed by a Professional Engineer licensed in the Commonwealth of Virginia. The picture to the side shows one of the many hangers where this occurs.

House Foundation

The front corners of the house foundation were exposed. This footing does not extend down 24" below grade to provide frost protection and does not meet code. Other areas of the house should be exposed to ensure that frost protection is met all the way around the building.

Conclusion

This work presented is subject to Engineering Solutions & Construction Management, PLC standard Terms and Conditions. It is based upon visual observations performed during the site visit. There may be hidden conditions that are not able to be evaluated. Should you have any questions, please do not hesitate to contact our office. We appreciate the opportunity to work with you on this project.

Sincerely,

ENGINEERING SOLUTIONS AND CONSTRUCTION MANAGEMENT, PLC

EVALUATION SUBJECT:

INDEX OF SIMPSON STRONG-TIE STAMPED AND WELDED COLD-FORMED STEEL PRODUCTS FOR WOOD OR COLD-FORMED STEEL CONSTRUCTION

1.0 EVALUATION SCOPE

This evaluation report provides a cross-reference index for Simpson Strong-Tie stamped and welded cold-formed steel products for wood and cold-formed steel construction that are labeled with evaluation report number ESR-2523. The products are cross-referenced to the evaluation reports that provide product descriptions, installation requirements, the codes under which the specific products are recognized, allowable loads, names of the inspection agencies (for welded products), and limitations on use of the specific products.

2.0 IDENTIFICATION

- **2.1** The products noted in this evaluation report are labeled with evaluation report number ESR-2523 and with information as specified in the applicable evaluation report for the product. Welded products must be labeled with the name of the inspection agency, when required by the evaluation report on the product.
- **2.2** The report holder's contact information is the following:

SIMPSON STRONG-TIE COMPANY INC. 5956 WEST LAS POSITAS BOULEVARD PLEASANTON, CALIFORNIA 94588 (800) 999-5099 www.strongtie.com

ICC-ES Evaluation Reports are not to be construed as representing aesthetics or any other attributes not specifically addressed, nor are they to be construed as an endorsement of the subject of the report or a recommendation for its use. There is no warranty by ICC Evaluation Service, LLC, express or implied, as to any finding or other matter in this report, or as to any product covered by the report.

Fastener Types and Sizes Specified for Simpson Strong-Tie Connectors

Many Simpson Strong-Tie connectors have been designed and tested for use with specific types and sizes of fasteners. The specified quantity, type and size of fastener must be installed in the correct holes on the connector to achieve published loads. Other factors such as fastener material and finish are also important. Incorrect fastener selection or installation can compromise connector performance and could lead to failure. For more information about fasteners, see our <u>Fastening Systems</u> <u>catalog</u> or access our <u>Fastener Finder software</u>.

The Simpson Strong-Tie[®] Strong-Drive[®] SD Connector screw is the only screw approved for use with our connectors.

The allowable loads of stainless-steel connectors match those of carbon-steel connectors when installed with Simpson Strong-Tie[®] stainless- steel, SCNR ring-shank nails.

SIMPSON Strong-Tie

Fastener Design Information

In some cases, it is desirable to install Simpson Strong-Tie face-mount joist hangers, post basses and caps, and straight straps and with nails that are a different type or size than what is called out in the load table. In these cases, these reduction factors must be applied to the allowable loads listed for the connector.

Load Adjustment Factors for Optional Fasteners Used with Face-Mount Hangers, Post Bases and Caps, and Straight Straps

- 1. Allowable load adjustment factors shown in the table are applicable to all face-mount hangers, post bases and caps, and straight straps throughout this catalog, except as noted in the footnotes below.
- 2. Some products have been tested specifically with alternative fasteners and have allowable load adjustment factors or reduced capacities published on the specific product page. Values published on the product page may be used in lieu of using this table.
- 3. This table does not apply to SUR/SUL/HSUR/HSUL hangers or to hangers modified per allowed options, or to connectors made from steel thicker than 10 ga.
- Strong-Drive[®] SD Connector screw substitutions in this table do not apply to sloped, skewed, or double-shear hangers. Strong-Drive SD Connector screws may be used in these connectors. For additional information and specific allowable loads, refer to <u>Strong-Drive</u> <u>SD Connector screws</u>.
- 5. Nails and Strong-Drive[®] SD Connector screws may not be combined in a connection.
- 6. Do not substitute 0.148" x 1 1/2" nails for face nails in slope and skew combinations or in skewed-only LSU.
- 7. For straps installed over wood structural panel sheathing, use a 21/2"-long fastener minimum.
- 8. Where noted, use 0.80 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.
- 9. Where noted, use 0.92 for 10 ga., 11 ga., and 12 ga. products when using SPF lumber.

For LUS, MUS, HUS, LRU, HHUS and HGUS Hangers

Double-shear nailing shall use minimum 2 1/2"-long nails or 2 1/2"-long SD screws

Shorter fasteners may not be used as double-shear nails

"MAX" suffix to the model number indicates that both round and triangular holes must be filled with the quantity of screws ÷

Tabulated allowable loads have been adjusted for a load duration factor. C_{in} of 1.6, corresponding to a ten-minute load duration (i.e., wind or entitypate loading), in accordance with the NOS. The adiovable loads do not apply to loads of other durations. Tabulated allowable loads are for a pair of connections, with one connector installed on each side of the beam. Tabulated allowable loads apply only to cases in which the beam is continuous through the connector. Tabulated uplift and lateral loads cample or the combined on tabut the advance loads uplift and lateral loads apply only to cases in which the beam is continuous through the connector. N

Tabulated allowable loads have been adjusted for load duration factors, *C₈*, as shown, in accordance with the NDS, and are not premitted to be adjusted for other load durations. LU series hangers provide for solver load durations. LU series hangers provide transloant resistence, which is defined as a moment of not less than 75 pounds times the depth of the jost at which the lateral movement of the lost post boltow for the jost with respect to 15 witch and size to 125 inch (3.2 mm). The height, H, do the jost shanger hangers the at least 60 percent of the lost of the jost unless additional lateral restraint is provided, as designed by others.

ICC-ES Evaluation Report

ESR-3096 LABC and LARC Supplement Reissued January 2021

Revised February 2021 This report is subject to renewal January 2022.

A Subsidiary of the International Code Council® www.icc-es.org | (800) 423-6587 | (562) 699-0543

DIVISION: 06 00 00—WOOD, PLASTICS AND COMPOSITES Section: 06 05 23—Wood, Plastic, and Composite Fastenings

REPORT HOLDER:

SIMPSON STRONG-TIE COMPANY INC.

EVALUATION SUBJECT:

SIMPSON STRONG-TIE® CONNECTORS USING SD-SERIES SCREWS

1.0 REPORT PURPOSE AND SCOPE

Purpose:

The purpose of this evaluation report supplement is to indicate that Simpson Strong-Tie[®] connectors used as wood framing connectors, described in ICC-ES evaluation report <u>ESR-3096</u>, have also been evaluated for compliance with the codes noted below as adopted by the Los Angeles Department of Building and Safety (LADBS).

Applicable code editions:

2020 City of Los Angeles Building Code (LABC)

- 2020 City of Los Angeles Residential Code (LARC)
 - 2.0 CONCLUSIONS

The Simpson Strong-Tie® connectors used as wood framing connectors, described in Sections 2.0 through 7.0 of the evaluation report ESR-3096, comply with the LABC Chapter 23, and the LARC, and are subject to the conditions of use described in this supplement.

3.0 CONDITIONS OF USE

The Simpson Strong-Tie connectors used as wood framing connectors, described in this evaluation report supplement, must comply with all of the following conditions:

- All applicable sections in the evaluation report ESR-3096.
- The design, installation, conditions of use and labeling are in accordance with the 2018 International Building Code[®] (2018 IBC) provisions noted in the evaluation report ESR-3096.
- The design, installation and inspection are in accordance with additional requirements of LABC Chapters 16 and 17, as
 - applicable
 - Under the LARC, an engineered design in accordance with LARC Section R301.1.3 must be submitted.
- This supplement expires concurrently with the evaluation report, reissued January 2021 and revised February 2021

For St. 1 inch = 25.4 mm. 1 tot = 4.45 N, 1 psi =0.835 kr-a. Allowable loads have been adjusted for load duration factors, C₆, as shown, in accordance with the NDS. The allowable loads do not apply to loads of other durations, and are not permitted to be adjusted for other load durations. See Sections 4.1 and 4.2 for additional design and

restalations requirements. See Section 3,14,30 required fasterier dimensions and mechanical properties. "See Section 3,14,30 required fasterier dimensions and mechanical properties. "Allowable loads aflown are for installations in wood members complying with Section 3,14,2. Wood members must also have a minimum reference compression perpendicular to grain design value. F_{4-m}, of 825 psi (3,17 MPa). "Ut hangers provide resistance, up to a maximum joid depth of H + 1.0 inch (H + 25.4 mm), where torsional resistance is defined as a moment not less than 75 pounds (33.4) lineates depth of the joist, at which the lateral movement of the top or bottom of the joist with respect to the vertical position of the joist is 0,125 inch (3,2 mm).

¹Allowable loads have been adjusted for load duration factors. C₀, as shown, in accordance with the NDS. The allowable loads do not apply to loads of other durations, and are not permitted to be adjusted for other load durations. See Sections 4.1 and 4.2 for additional design and restallations requirements. See Section 3.14.1. For required harmonic and are not permitted to be adjusted for other load durations. See Section 3.14.2. Wood members must also have a minimum fieldence requirements. The Section 3.14.2. Wood members complying with Section 3.14.2. Wood members must also have a minimum fieldence to grant adjusted loads along the field of the 1.1 mich (H + 2.5 mm), where torsional resistances up to a maximum joist depth of H + 1.0 mich (H + 2.5 mm), where torsional resistances is diffined as a movent not less than 7.5 pounds (3.3.4) mises the depth of the joist, at which the lateral movement of the jost with respective to the varient loads along the section 5.14.2 mm), where torsional resistances up to a maximum joist, and the joist, at which the lateral movement of the jost with respective to the varient loads along the hard movement of the jost with respective to the varied loads for the point of the jost with a submet adjusted loads for the hard movement of the jost with respect to the varied loads for the note of the jost with the lateral movement of the jost with the stabulated allowable loads.

¹The minimum supported member heights, H, for the LGU, MGU, and HGU are 8°, 9/x², and 11°, respectively. ²Allowable loads have been adjusted for load duration factors. C₁₀ as shown, in accordance with the NDS, The allowable loads do not apply to addist of other durations, and are not for load duration factors. C₁₀ as shown, in accordance with the NDS, The allowable loads do not apply to institutions requirements. The WS3 is a 'x' 3° self-affiling screw described in <u>ER2/261</u> and re included with the hangers. ⁴Niovable loads shown are for institutions complying with Section 5.14.2. Wood members must also have a minimum reference compression perpendicular to grain design value, F_{cown} of 625 psi (4.31 MPa).

ICC-ES Evaluation Report

ESR-3445 FBC Supplement Reissued October 2020

This report is subject to renewal October 2022.

www.icc-es.org | (800) 423-6587 | (562) 699-0543 A Subsidiary of the International Code Council®

DIVISION: 06 00 00—WOOD, PLASTICS AND COMPOSITES Section: 06 05 23—Wood, Plastic, and Composite Fastenings

REPORT HOLDER:

MITEK", INC.

EVALUATION SUBJECT:

MiTek USP FACE MOUNT HANGERS 1.0 REPORT PURPOSE AND SCOPE

Purpose:

The purpose of this evaluation report supplement is to indicate that MiTek USP face mount hangers for connecting wood framing members, described in ICC-ES evaluation report ESR-3445, have also been evaluated for compliance with the codes moled below.

Applicable code editions:

2020 and 2017 Florida Building Code—Building

2020 and 2017 Florida Building Code—Residential

2.0 CONCLUSIONS

The that MTek USP face mount hangers, described in Sections 2.0 through 7.0 of the evaluation report ESR-3445, comply with the *Florida Building Code Building and* the *Florida Building Code Residential*, provided the design requirements are determined in accordance with the *Florida Building Code Building or the Florida Building Code Residential*, as applicable. The installation requirements noted in ICCES evaluation report ESR-3445 for the 2018 and 2015 International Building Code[®] meet the requirements of the *Florida Building Code Building or the Florida Building Code*.

Use of the MITek USP Face Mount Hangers has also been found to be in compliance with the High-Velocity Hurricane Zone (HVHZ) provisions of the *Florida Building Code—Building* and the *Florida Building Code—Residential* with the following condition:

a) For connections subject to uplift, the connection must be designed for no less than 700 pounds (3114 N).

For products falling under Florida Rule 61G20-3, verification that the report holder's quality assurance program is audited by a validy assurance entity approved by the Florida Building Commission for the type of inspections being conducted is the responsibility of an approved validation entity (or the code official, when the report holder does not possess an approval by the Commission).

This supplement expires concurrently with the evaluation report ESR-3445, reissued October 2020.

RCMS Endoamin Reports are not no le construit as toprocenting aerdareixo en ante obse attribues not portificable addressed, nor are due to be construid as an endoamine of the provise of incrementation for loss. There is non-transition for RCC Endoamin Series, ELC, operor ar include, as la none finding and the numer activity of a solution traverid for former.

Additional Documents Submitted by Augusta County (Page left blank intentionally)

COUNTY OF AUGUSTA COMMONWEALTH OF VIRGINIA DEPARTMENT OF COMMUNITY DEVELOPMENT P.O. BOX 590 COUNTY GOVERNMENT CENTER VERONA, VA 24482-0590

March 31, 2021

Office of the State Technical Review Board 600 East Main Street, Suite 300 Richmond VA, 23219

Members of the Board:

I am sending this updated letter due to additional information which has been submitted to our office regarding the trusses in item #6 of my February 17, 2021 letter to you. I have copied that part of the letter in the next paragraph for your reference. The appeal number is 21-02.

Item 6: On my July 8, 2020 inspection, Mrs. Davis showed me a photo of the trusses on the 2 X beam. She stated then that it was supposed to be a LVL. Our office performed the framing inspection on 11/12/2019 and I did not believe we would have missed something like that but out of an abundance of caution, I informed the contactor that an engineer would need to evaluate and approve or design repairs if needed. The engineer's report on item #3 states that the beam is adequate to safely support the loads at this location. He also looked at some additional trusses that were questioned by the Davises' and found them in compliance.

While I still feel that the Schnitzhofer engineering report satisfies these issues, some new truss issues have been discovered which will require additional evaluation. As such I cannot say all of the truss issues have been resolved on the project, just the ones in the Schnitzhofer report.

Basically, after my review of the report, and the new information I have received I found the report only fully resolved items 8, and 12 of the corrections letter to the contractor.

Sincerely,

M. N. Wiseram

G.W. Wiseman Building Official

VIRGINIA:

BEFORE THE STATE BUILDING CODE TECHNICAL REVIEW BOARD

IN RE: Appeal of Anthony T. Grant Appeal No. 21-03

REVIEW BOARD STAFF DOCUMENT

Suggested Statement of Case History and Pertinent Facts

1. In May of 2015, the City of Suffolk Planning and Community Development Office (City building official), the agency responsible for the enforcement of Part 1 of the 2009 Virginia Uniform Statewide Building Code (Virginia Construction Code or VCC), issued a final inspection and a subsequent Certificate of Occupancy to KEBCO, Inc. (KEBCO), a licensed Class A contractor, for a single-family dwelling it built at 4281 Cole Avenue in Suffolk.

2. In June of 2015, Ashley and Anthony T. Grant Jr. (Grant) purchased the dwelling from KEBCO.

3. In July of 2016, the City of Suffolk issued a summons to KEBCO. The summons listed three violations one of which was, Section M1401.3 "Improper sizing of heating and cooling equipment and appliances, Differences between original information submitted and 2nd reevaluation submitted."

4. In November of 2017 Grant filed an appeal to the City appeals board. In January of 2017, the City appeals board heard Grant's appeal and ruled to uphold the City building official's decision on several VCC Sections. The City appeals board also modified the City building official's decision concerning VCC Section M1401.3 (*Equipment and appliance sizing*) requiring additional testing; and chose to not render a decision.

(Page left blank intentionally)
5. Review Board staff conducted an informal fact-finding conference (IFFC) in April of 2017. At the conference it was determined that since the City appeals board had modified, and not upheld or reversed the City building official's decision on the sizing of the heating and cooling system, that issue would not be included in the issues for consideration by the Review Board. In that regard, staff explained to the parties that once the City building official made a determination on that issue, specifically whether the heating and cooling system was properly sized for the home, Grant could then choose whether to appeal the issue to the City appeals board.

6. Grant further appealed to the Review Board on March 2, 2017. The appeal was heard at the June 15, 2017 Review Board meeting; however, as agreed upon at the IFFC in April of 2017, the Review Board did not hear the issue related to M1401.3 (*Equipment and appliance sizing*) as the local board has not yet ruled on the issue.

7. On March 28, 2017, through a memorandum from the Assistant Director of Community Development to the Chairman of the City appeals board, the City determined the size of the heating and cooling system was sufficient. Grant appealed the decision to the City appeals board.

8. In November of 2017, the City appeals board heard Grant's appeal and ruled to uphold the Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately. Mr. Grant did not receive notification of the meeting; therefore, the City appeals board re-heard Grant's appeal in April of 2018 and again ruled to uphold the City Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately.

 $\mathbf{2}$

(Page left blank intentionally)

9. Grant further appealed to the Review Board on June 26, 2018. The Review Board heard Grant's appeal at its November 16, 2018 meeting; the Review Board final order was approved at the January 11, 2019 meeting where the Review Board overturned the decision of the City appeals board that the HVAC system was properly sized. The Review Board remanded the matter back to the City appeals board "for a better evaluation of the HVAC system based on the Manual S, J, and D calculations including all inputs to include but not limited to roof color, coefficient of shading, air changes per day, and insulated values of windows, doors, walls, ceilings and floors from the "as built" HVAC system conditions and calculations in order to make the determination as to the adequacy of the HVAC system within 60 days. The Review Board strongly suggests the City appeals board require this information from a third party HVAC contractor in addition to what may be provided by Able's."

10. Due to the lack of action by the City appeals board, on July 27, 2020 Grant, through his attorney, filed a Show Cause Order or Enforcement of Decision of the State Building Code Technical Review Board against the City of Suffolk, in the City of Suffolk Circuit Court.

11. On January 27, 2021, the City appeals board again ruled to uphold the decision of the City building official that the heating and cooling system was sized appropriately.

12. On February 23, 2021, Grant further appealed to the Review Board stating that the City appeals board had not complied with the Review Board Remand Order dated January 11, 2019.

13. This staff document along with a copy of all documents submitted will be sent to the parties and opportunity given for the submittal of additions, corrections or objections to the staff document, and the submittal of additional documents or written arguments to be included in

(Page left blank intentionally)

the information distributed to the Review Board members for the appeal hearing before the Review Board.

Suggested Issue for Resolution by the Review Board

1. Whether the City of Suffolk has complied with the Remand Order dated January

11, 2019.

If the Review Board finds that the City of Suffolk has not complied with the Remand Order dated January 1, 2019 then:

 How to handle the City's refusal to comply with the Remand Order dated January 11, 2019. (Page left blank intentionally)

<u>COMPLAINT REQUESTING SHOW CAUSE ORDER OR ENFORCEMENT OF</u> <u>DECISION OF STATE BUILDING CODE TECHNICAL REVIEW BOARD</u>

Plaintiff Anthony Grant ("Grant"), by counsel, hereby files this Complaint Requesting

Show Cause Order or Enforcement of Decision of State Building Code Technical Review Board

against the City of Suffolk (the "City") and in support thereof states as follows:

The Parties

1. Grant is an individual and a resident of Suffolk, Virginia, and the owner of

property located at 4281 Cole Avenue in the City of Suffolk (the "Property").

2. The City is a political entity created by the laws and statutes of the

Commonwealth of Virginia.

Factual Background

3. In June 2016, the City issued a summons to KEBCO Enterprises, Inc.

("KEBCO") listing three violations one of which was, VCC Section M1401.3 "Improper sizing of the heating and cooling equipment and appliance, Differences between original information submitted and 2nd re-evaluation submitted." 4. In November 2016, Grant filed an appeal of the enforcement action under the Virginia Construction Code to the City appeals board which was heard in January 2017. The City appeals board modified the City building official's decision concerning VCC Section M1401.3 (Equipment and appliance sizing) requiring additional testing and chose not to render a decision.

5. Staff for the Virginia State Building Code Technical Review Board (the "Review Board") conducted an informal fact-finding conference (the "IFFC") in April 2017. At the conference, it was determined that, since the City appeals board had modified, and not upheld or reversed, the City building official's decision on the sizing of the heating and cooling system, that issue would not be included in the issues for consideration by the Review Board. In that regard, staff explained to the parties that once the City building official made a determination on that issue, specifically whether the heating and cooling system was properly sized for the home, Grant could then choose whether to appeal the issue to the City appeals board.

6. Grant further appealed to the Review Board on March 2, 2017. The appeal was heard at the June 15, 2017, Review Board meeting; however, as agreed upon at the IFFC in April of 2017, the Review Board did not hear the issue related to M1401.3 (Equipment and appliance sizing) as the local board has not yet ruled on the issue.

7. On March 28, 2017, through a memorandum from the Assistant Director of Community Development to the Chairman of the City appeals board, the City determined the size of the heating and cooling system was sufficient. Grant appealed the decision to the City appeals board.

8. In November of 2017, the City appeals board heard Grant's appeal and ruled to uphold the Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately. Mr. Grant did not receive notification of the meeting;

therefore, the City appeals board re-heard Grant's appeal in April of 2018 and again ruled to uphold the City Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately. Grant further appealed to the Review Board on June 26, 2018

9. On January 11, 2019, after conducting a hearing on the appeal, the Review Board issued a decision (the "Decision"). A copy of the Decision is attached as <u>Exhibit A</u>.

10. At the hearing, The City argued that they relied on the design calculations provided by the HVAC contractor who installed the system, Wayne Able's Heating and A/C (Able's), the product ratings for the equipment that was installed in the home, and Able's testimony at the City appeals board hearing to make the decision of the adequacy of the system.

11. Mr. Grant argued that the HVAC system was not the correct size for the home and that a larger unit or a second unit was needed based on an inspection by a home inspector, the evaluation of the system by two other HVAC contractors that did not install the system, and the load calculations provided by a HVAC third contractor.

12. The Review Board overturned the decision of the City appeals board that the HVAC system was properly sized.

13. The Review Board ordered matter to be remanded to the City appeals board for a better evaluation of the HVAC system based on the Manual S, J, and D calculations including all inputs to include but not limited to roof color, coefficient of shading, air changes per day, and insulated values of windows, doors, walls, ceilings and floors from the "as built" HVAC system conditions and calculations in order to make the determination as to the adequacy of the HVAC system within 60 days. The Review Board strongly suggested that the City appeals board require

this information from a third party HVAC contractor in addition to what may be provided by Able's.

14. The City failed to comply with the Decision. It has not made any significant efforts to comply with the Decision, despite ample opportunity to do so. Both Grant and his council have made multiple attempts to coordinate compliance without success.

15. Grant has been forced to retain counsel to enforce the Decision and has incurred costs in doing so. Additionally, he has been damaged by being forced to continue to live in a home that does not have appropriate cooling, and the City's inaction has prolonged resolution of the problem.

<u>COUNT I – Motion for Show Cause Order</u>

16. Pursuant to Virginia Code § 36-114, proceedings of the Review Board are governed by Virginia's Administrative Process Act (Virginia Code § 2.2-4000, *et seq.*).

17. Pursuant to the Administrative Process Act, under Virginia Code § 2.2-4023, final orders from any agency decision may be recorded, enforced, and satisfied as orders or decrees of a circuit court upon certification of such orders by the agency head or his designee.

18. The Decision, certified by the Chairman of the Review Board, is an order that is enforceable by this Court as any other order issued by this Court.

19. The City is in violation of the Decision and should be required to show cause why it should not be held in contempt of Court for failing to comply with the Order.

WHEREFORE, Grant respectfully moves this Court to enter an order:

A. Requiring the City to show cause as to why it should not be held in contempt of Court for failing to comply with the Order;

B. Requiring the City to immediately comply with the Decision;

C. Imposing a fine sufficient to encourage compliance by the City in an amount at least as much as Plaintiff's attorney's fees expended in this matter; and

D. Providing such other and further relief as may be warranted upon the facts and circumstances of this case.

Respectfully submitted,

ANTHONY GRANT

By: Coursel

BEFORE THE STATE BUILDING CODE TECHNICAL REVIEW BOARD (REVIEW BOARD)

IN RE: Appeal of Anthony Grant Jr. Appeal No. 18-10

DECISION OF THE REVIEW BOARD

Procedural Background

The State Building Code Technical Review Board (Review Board) is a Governorappointed board established to rule on disputes arising from application of regulations of the Department of Housing and Community Development. See §§ 36-108 and 36-114 of the Code of Virginia. The Review Board's proceedings are governed by the Virginia Administrative Process Act (§ 2.2-4000 et seq. of the Code of Virginia).

Case History

In May of 2015 the City of Suffolk Department of Planning and Community Development (City), the department responsible for code enforcement of Part I of the 2009 Virginia Uniform Statewide Building Code (Virginia Construction Code or VCC), issued a final inspection and a subsequent Certificate of Occupancy to KEBCO Enterprises, Inc. (KEBCO), the licensed Class A contractor for a single family dwelling built at 4281 Cole Avenue in the City of Suffolk.

Anthony and Ashley Grant Jr. purchased the home from KEBCO in June of 2015. In June of 2016 the City issued a summons to KEBCO listing three violations one of which was, VCC Section M1401.3 "Improper sizing of the heating and cooling equipment and appliance, Differences between original information submitted and 2nd re-evaluation submitted".

In November of 2016 Mr. Grant filed an appeal of the enforcement action under the Virginia Construction Code to the City appeals board which was heard in January of 2017. The

City appeals board modified the City building official's decision concerning VCC Section M1401.3 (Equipment and appliance sizing) requiring additional testing; and chose not to render a decision.

Review Board staff conducted an informal fact-finding conference (IFFC) in April of 2017. At the conference it was determined that since the City appeals board had modified, and not upheld or reversed the City building official's decision on the sizing of the heating and cooling system, that issue would not be included in the issues for consideration by the Review Board. In that regard, staff explained to the parties that once the City building official made a determination on that issue, specifically whether the heating and cooling system was properly sized for the home, Grant could then choose whether to appeal the issue to the City appeals board.

Grant further appealed to the Review Board on March 2, 2017. The appeal was heard at the June 15, 2017 Review Board meeting; however, as agreed upon at the IFFC in April of 2017, the Review Board did not hear the issue related to M1401.3 (Equipment and appliance sizing) as the local board has not yet ruled on the issue.

On March 28, 2017, through a memorandum from the Assistant Director of Community Development to the Chairman of the City appeals board, the City determined the size of the heating and cooling system was sufficient. Grant appealed the decision to the City appeals board.

In November of 2017, the City appeals board heard Grant's appeal and ruled to uphold the Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately. Mr. Grant did not receive notification of the meeting; therefore, the City appeals board re-heard Grant's appeal in April of 2018 and again ruled to uphold the City Assistant Director of Community Development's decision that the heating and cooling system was sized appropriately. Grant further appealed to the Review Board on June 26, 2018 Appearing at the Review Board hearing for the City of Suffolk were Stanley Skinner, Assistant Director of Community Development; Sam Adams, Inspector; and Kalli Jackson, Assistant City Attorney. Mr. Grant appeared at the hearing on behalf of the Grants.

Findings of the Review Board

The City filed a preliminary motion arguing that the case should be dismissed because the memorandum from the City building official to the Chairman of the City appeals board was not an application by the City building official, but rather a result of a request from the City appeals board. The City further argued that the appeal should be dismissed because the appeal was not properly before the board because the action related to the sizing of the HVAC system was not through a notice of violation, but rather through a summons for civil penalty in the City of Suffolk General District Court. The City also argued that the appeal should be dismissed because the appeals board and the date he filed the appeal with the Review Board.

A. Whether or not the memorandum from the Assistant Director of Planning and Community Development to the Chairman of the City appeal board constitutes an enforcement decision by the City building official.

The City argued that the memorandum was not an enforcement decision of the City building official but rather was a result of a local appeals board hearing. The City further argued that the memorandum was a response to the request of the City appeals board to provide more information after re-studying the HVAC system numbers and to provide the City appeals board with a second opinion. Mr. Grant argued that the memorandum was a decision of the building official. The Review Board finds that the memorandum did constitute an application by the City building official.

B. Whether or not to dismiss the Grant's appeal as not properly before the Review Board since the only action required related to the sizing of the heating and cooling system was not

through a notice of violation issued by the building official, but rather through a summons issued to KEBCO for a civil penalty in the city of Suffolk General District Court, and whether or not the decision of the City appeals board should be vacated.

The City argued that the appeal was not properly before the Review Board because the action required related to the sizing of the HVAC system was not through a notice of violation issued by the building official, but rather through a summons issued to KEBCO for a civil penalty. The City further argued that this decision had been previously decided by the Review Board in the final order for Appeal No. 17-3 filed by the Grants in 2017. Mr. Grant argued that the appeal was properly before the Board because the summons was issued as a result of KEBCO's refusal to make the needed corrections to the HVAC system and that the City did not follow through with the summons to ensure the cited items were corrected. The Review Board finds that the City building official, in the memorandum to the City's appeal board, performed an intervening action related to the HVAC issue cited under VCC Section M1401.3, by restating and making the same determination indicated in the summons; therefore, making it appropriate to hear the appeal and not inconsistent with the decision of Appeal 17-3.

C. <u>Whether or not the Grant's appeal should be dismissed as untimely and whether or not the</u> <u>decision of the City appeals board should be vacated</u>

The City argued that Mr. Grant received a copy of the City appeals board decision on June 4, 2018 and did not file an appeal to the Review Board until June 26, 2018: therefore, the appeal was not filed within the 21 day deadline and is untimely. Mr. Grant argued that his attorney, Mr. Bell, received a copy of the City appeals board decision on June 6, 2018; therefore, the appeal was filed within 21 days and was timely. The City argued that it sent a copy of the decision to Mr. Bell, who represented Mr. Grant is other court proceedings, only as a courtesy. The City further argued that Mr. Grant filed the application to the City appeals board and represented himself at the City appeals board hearings; therefore, the date of record was when the decision was received by Mr. Grant. The Review Board finds that the City created confusion by sending the decision to Mr. Bell, that because Mr. Grant was represented at the time the timeline should begin when his attorney received the copy, and further finds the appeal to be timely. Having ruled against the City's argument for procedural dismissal, the Board moved onto the arguments on merits.

D. Whether or not to overturn the decision of the City building official and the City appeals board that a violation of VCC Section M1401.3 (Equipment and appliance sizing) does not exist concerning the sizing of the heating and cooling system.

The City argued that they relied on the design calculations provided by the HVAC contractor who installed the system, Wayne Able's Heating and A/C (Able's), the product ratings for the equipment that was installed in the home, and Able's testimony at the City appeals board hearing to make the decision of the adequacy of the system.

Mr. Grant argued that the HVAC system was not the correct size for the home and that a larger unit or a second unit was needed based on an inspection by a home inspector, the evaluation of the system by two other HVAC contractors that did not install the system, and the load calculations provided by a HVAC third contractor. The Review Board finds there to be insufficient information present to make an informed decision and remands the appeal back to the City appeals board for a better evaluation of the HVAC system.

<u>Order</u>

A. <u>Whether or not the memorandum from the Assistant Director of Planning and Community</u> <u>Development to the Chairman of the City appeal board constitutes an enforcement decision</u> by the City building official.

The appeal having been given due regard, and for the reasons set out herein, the Review Board members order the decision of the City appeals board that the memorandum was an action of the City building official to be, and hereby is, upheld.

B. <u>Whether or not to dismiss the Grant's appeal as not properly before the Review Board since</u> the only action required related to the sizing of the heating and cooling system was not through a notice of violation issued by the building official, but rather through a summons issued to KEBCO for a civil penalty in the city of Suffolk General District Court, and whether or not the decision of the City appeals board should be vacated.

The appeal having been given due regard, and for the reasons set out herein, the Review Board members order the decision of the City appeals board that the appeal was properly before the Board to be, and hereby is, upheld.

C. Whether or not the Grant's appeal should be dismissed as untimely and whether or not the decision of the City appeal board should be vacated.

The appeal having been given due regard, and for the reasons set out herein, the Review Board members order the decision of the City appeals board that the appeal was timely to be, and hereby is, upheld.

D. Whether or not to overturn the decision of the City building official and the City appeals board that a violation of VCC Section M1401.3 (Equipment and appliance sizing) does not exist concerning the sizing of the heating and cooling system.

The appeal having been given due regard, and for the reasons set out herein, the Review

Board members order the decision of the City appeals board that the HVAC system is properly

sized to be, and hereby is, overturned.

Remand Order

The appeal having been given due regard, and for the reasons set out herein, the Review Board orders this matter to be, and hereby is, remanded to the City appeals board for a better evaluation of the HVAC system based on the Manual S, J, and D calculations including all inputs to include but not limited to roof color, coefficient of shading, air changes per day, and insulated values of windows, doors, walls, ceilings and floors from the "as built" HVAC system conditions and calculations in order to make the determination as to the adequacy of the HVAC system within 60 days. The Review Board strongly suggests the City appeals board require this information from a third party HVAC contractor in addition to what may be provided by Able's.

November 30, 2016

To Whom It May Concern,

I would like to appeal the notice of violation for the dates of 5/18/15, 10/28/16, 5/13/16, 12/22/15, 4/25/16, and 6/24/16 regarding section N1102.4, section R-703.11, 408 and section R408. Also, VUSBC109.3, M1401.3, P2603.21, R403.1.6 and P2603.2.1. The Inspection report project number SFC2014-00187. I am unsure of the code violations for our driveway; however the builder did not have a permit to build. Our driveway and garage floor is cracking severely. I spoke to the building official on the issue; he stated that it was not his department. I would like to appeal these violations because the building official issued them, and then removed them without them being addressed. My family and i have endured a lot during our first year within the home; due to a lot of violations that were passed that should not have been. We have contacted the builder, the city of Suffolk and numerous third party vendors to address the issues with our home. We have documentation from numerous reputable companies and a structural engineer report that stated the issues with our home. My family and I have been very patient with the building official in allowing him to address the violations, which have not been addressed appropriately. In my efforts in trying to have my home fixed, I feel defeated. The city in which I live has not fully taken responsibility for their negligence and my family and I have been suffering. With my sincerest regards, I hope this appeal will look at the documentation that is being presented and help me in addressing the issues, so that my family and I can enjoy living in the home we fell in love with, and the community in which we cherish. As I conclude, I would like you all to resolve these issues by addressing the code violations that are listed above. The builder has had numerous opportunities to correct some violations; however, he has failed to do so. He has displayed poor workmanship and professionalism. Again, we would like for the violations to be addressed accordingly. We do not want the builder to come back to our home to fix the issues, due to his poor workmanship, lack of professionalism and continuous issues due to his negligence. We would like for the builder to be fined, along with DPOR being notified of the violations.

Warm Regards,

wong 1. set fi. Anthony T. Grant Jr

RESOLUTION NO. <u>01-2020</u>

CITY OF SUFFOLK BOARD OF BUILDING CODE APPEALS DECISION 4281 COLE AVE, SUFFOLK, VIRGINIA, ZONING MAP 13A *JAMES, PARCEL *18 LBBCA 01-2020

WHEREAS, The State Building Code Technical Review Board, by letter dated January 11, 2019, requested the this matter be remanded back to the City of Suffolk Board of Building Code Appeals as it relates to the sizing of Mr. Anthony Grant, Jr., HVAC system based on the Manual S, J, and D calculation including all inputs to include but not limited to roof color, coefficient of shading, air changers per day, and insulated value of windows, doors, walls, ceilings and floors from the "as built" HVAC system conditions and calculations in order to make the determination as the adequacy of the HVAC system; and

WHEREAS, the appeal hearing was held in the City of Suffolk Council Chambers on January 27, 2021, at 12:00 p.m. under New Business; and

WHEREAS, the applicant Anthony Grant and his Attorney Gregory Bean were present at the hearing and representing the City of Suffolk were Michael Robinson, Building Official, Sean Dolan, Assistant City Attorney II, Carl Stevens – Trademark Mechanical and Jeff Sadler - Ecovative Energy; and

NOW, THEREFORE, BE IT RESOLVED by the Board of Building Code Appeals of the City of Suffolk, Virginia, that:

1. <u>X</u> UPHOLDS ______ REVERSES ______ MODIFIES the Building Official's decision with respect to appeal identified as M1401.3/No. 18-10 from the State Building Code Technical Review Board under New Business; and,

BE IF FURTHER RESOLVED that any person who was a party to the appeal may appeal to the State Review Board by submitting an application to such Board within 21 calendar days upon receipt by certified mail of this resolution. Application forms are available for the office of the State Review Board, 600 East Main Street, Richmond, Virginia 23219, and (804) 371-7150.

Yes it is.

On Tue, Feb 23, 2021, 10:53 AM Luter, William <travis.luter@dhcd.virginia.gov> wrote: Mr. Grant,

Based on your inquiries to Review Board staff via telephone related to your appeal application, your submitted documents thus far, and your email below it appears to Review Board staff that, in your opinion, the City of Suffolk has not complied with the Remand Order of the Review Board dated January 11, 2019. Is this an accurate assessment of your position? Is it also accurate that you would like the Review Board to determine whether the City has complied with the Remand Order and, if not, to force the City of Suffolk to comply with the order? Are there any other code related issues that you wish for the Review Board to consider?

The information below is submitted by The City of Suffolk for review by the Local Board of Building Code Appeals in relation to the appeal by Anthony Grant to the HVAC system sizing (2009VCC M1401.3), installed by Wayne Ables Heating and Air Conditioning, at 4281 Cole Avenue.

A. The Information previously provided by Wayne Ables relating to the appeal of 2009 VCC section M1401.3 (Equipment and appliance sizing) for 4281 Cole Ave, and the code section that was appealed(M1401.3).

B. The 2019 State Building Code Technical Review Board summary and decisions related to their review of the appeal.

C. "Building Information and Data Collection" provided by Ecovative Energy for the "as-built" conditions. Trademark Mechanical generated a house layout prior to the site visit by Ecovative using the site plan and building plans the City of Suffolk has on file, that Ecovative used for documenting hvac layout and information of windows and doors.

D. Test results from Ecovative's testing of the house's duct tightness and building envelope tightness to establish the air changes per hour(ACH) of the building envelope and the amount of duct leakage in the "as-built" conditions. The relevant code sections from the applicable 2009 code year are attached to the results. (max. 12% total allowed for duct leakage, actual=2.9%; max. 7 ACH allowed for envelope air tightness, actual=6.13)

E. This is the updated Load calculation provided by Trademark Mechanical based on the "as-built condition" information provided by Ecovative and the applicable ACCA Manual of the time of construction.

F. Building analysis report provided by Ecovative. This report identifies observations that may contribute to comfortability of the home or that could be addressed to increase comfortability of the interior environment. Ecovative identified several observations in an effort to help provide direction for achieving the preferred interior environment of the homeowner.

G. Supplemental information provided by Ecovative in relation to their observations including the initial floorplan and load calculation performed by Trademark mechanical based on the building plans and images obtained during Ecovative's evaluation.

CITY INFORMATION: A

July 20, 2016

Dear Sirs,

The original load calculations submitted were the load calculations from the first floor of Kenny's 2-story house with a 2-zone system, that was the first page and the 2nd page was the actual house on Cole Ave with a 1-zone system. My office clerk mixed up the paperwork. If you look at the load calculations that say 2 story one zone, the net gain is 22,720 which is almost the same as the load calculations that say 4281 Cole Ave. Its net gain is 23,512, 792 BTUs different. Not enough difference to matter on any day @ any temperature. As evidenced by the expanded cooling data. This unit supplies 26,300 BTUs, enough to cool the house on any given day. I have included a ACCA Manuel J information sheet about the "Proper" way to size a/c equipment

Thank you, Wayne Ables

Wayne Ables Heating & Air Conditioning, Inc.

1226 Executive Boulevard Suite 117 Chesapeake, VA 23320 757-547-9252 Fax 757-547-1502 Email: wayneables@hvac.hrcoxmall.com

Dear Mr. Wilson,

This is a re-do of the load calculations at 4281 Cole Ave. Cole Ave. has an outdoor unit, Model # GSZ130301 and an indoor unit, Model # ARUF30B14A. As supported by the load calculations and the expanded rating of the outdoor unit, this system is properly sized for this home.

The home inspector's feeling that the system is too small is not the proper method for sizing any heating and cooling system. It is possible that a properly sized system will run longer than an oversized system, but that is the benefit of a properly sized system. There is no such thing as a standard sized system for any home and a 3 ton system for this home is oversized and would be a code violation.

Too many home inspectors base the size of a system on a square foot per ton. This is only a guess-timation. It doesn't account for the different R values of the home, types of windows, or any other factors. No oversite was made with this system.

Thank you,

Wayne Ables

CHAPTER 14

HEATING AND COOLING EQUIPMENT

SECTION M1401 GENERAL

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's installation instructions and the requirements of this code.

M1401.2 Access. Heating and cooling *equipment* shall be located with respect to building construction and other *equipment* to permit maintenance, servicing and replacement. Clearances shall be maintained to permit cleaning of heating and cooling surfaces; replacement of filters, blowers, motors, controls and vent connections; lubrication of moving parts; and adjustments.

M1401.3 Sizing. Heating and cooling *equipment* shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other *approved* heating and cooling calculation methodologies.

M1401.4 Exterior installations. Equipment installed outdoors shall be *listed* and *labeled* for outdoor installation. Supports and foundations shall, prevent excessive vibration, settlement or movement of the equipment. Supports and foundations shall be level and conform to the manufacturer's installation instructions.

M1401.5 Flood hazard. In areas prone to flooding as established by Table R301.2(1), heating and cooling *equipment* and *appliances* shall be located or installed in accordance with Section R322.1.6.

SECTION M1402 CENTRAL FURNACES

M1402.1 General. Oil-fired central furnaces shall conform to ANSI/UL 727. Electric furnaces shall conform to UL 1995.

M1402.2 Clearances. Clearances shall be provided in accordance with the *listing* and the manufacturer's installation instructions.

M1402.3 Combustion air. Combustion air shall be supplied in accordance with Chapter 17. Combustion air openings shall be unobstructed for a distance of not less than 6 inches (152 mm) in front of the openings.

SECTION M1403 HEAT PUMP EQUIPMENT

M1403.1 Heat pumps. The minimum unobstructed total area of the outside and return air ducts or openings to a heat pump shall be not less than 6 square inches per 1,000 Btu/h (13 208 mm²/kW) output rating or as indicated by the conditions of the listing of the heat pump. Electric heat pumps shall conform to UL 1995.

2009 VIRGINIA RESIDENTIAL CODE

M1403.2 Foundations and supports. Supports and foundations for the outdoor unit of a heat pump shall be raised at least 3 inches (76 mm) above the ground to permit free drainage of defrost water, and shall conform to the manufacturer's installation instructions.

SECTION M1404 REFRIGERATION COOLING EQUIPMENT

M1404.1 Compliance. Refrigeration cooling *equipment* shall comply with Section M1411.

SECTION M1405 BASEBOARD CONVECTORS

M1405.1 General. Electric baseboard convectors shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code.

SECTION M1406 RADIANT HEATING SYSTEMS

M1406.1 General. Electric radiant heating systems shall be installed in accordance with the manufacturer's installation instructions and Chapters 34 through 43 of this code.

M1406.2 Clearances. Clearances for radiant heating panels or elements to any wiring, outlet boxes and junction boxes used for installing electrical devices or mounting luminaires shall comply with Chapters 34 through 43 of this code.

M1406.3 Installation of radiant panels. Radiant panels installed on wood framing shall conform to the following requirements:

- 1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or mounted between framing members.
- 2. Panels shall be nailed or stapled only through the unheated portions provided for this purpose and shall not be fastened at any point closer than 1/4 inch (6.4 mm) to an element.
- 3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

M1406.4 Installation in concrete or masonry. Radiant heating systems installed in concrete or masonry shall conform to the following requirements:

- Radiant heating systems shall be identified as being suitable for the installation, and shall be secured in place as specified in the manufacturer's installation instructions.
- 2. Radiant heating panels or radiant heating panel sets shall not be installed where they bridge expansion joints unless protected from expansion and contraction.

Staff Note: This document was removed as it was a duplicate copy of the Review Board Final Order 18-5 which is in the Basic Documents section of the record.

CITY INFORMATION: C

Building Information and Data Collection

August 31, 2020 4281 Cole Ave, Suffolk VA Client: City of Suffolk

Exterior Notes:

- -Siding is light beige vinyl with white trim
- Medium color brick veneer over crawlspace foundation walls

-Medium color asphalt shingles

-Front of home is facing N/NW

-Shading from trees on SW side of home

First Floor Notes:

-Thermostat centrally located at bottom of stairs. One system, one zone

-No return duct on first floor

-Flooring is all VCT on entire first floor

-Sits on top of vented crawlspace with vapor barrier

-Floor joist insulation is paper-faced fiberglass batt (5.5" thick - R-value lettering not

visible due to mold and moisture stains on paper face of insulation batts)

-Foundation walls are 2' high from grade to bottom of framing

-Floor joists are 2x8 @16" OC

-Insulation on exterior walls confirmed as fiberglass batts, but thickness and face vs. unfaced is unknown

Second Floor Notes:

-All flooring is carpet except for Master bathroom which is tile

-Floor joists are 2x8 @ 16" OC

-Master BR has different ceiling height and drop soffit where only supply grill is located -Insulation of floor joists for room over garage confirmed, but thickness unknown -Insulation on exterior walls confirmed as fiberglass batts, but thickness and face vs. unfaced is unknown

Window Notes:

-All windows are double pane with no Low-E coating

-Bottom half have bug screens on outside of pane

-All windows have 45 deg. angle blinds (except windows noted on drawings without) -All windows are vinyl frame and sash

-Front entry door only exterior door with glazing (noted on drawings)

www.ecovativeenergy.com

Far 757.963.1443

Building Information and Data Collection

Attic Notes:

-Ceiling joists are 2x8 @ 16" OC

-Insulation is blown in loose-fill fiberglass @ 14-15" high (7-8" continuous R-value over studs)

-Attic pulldown stairs has R-5 foam board on door panel -Attic is vented with soffits and static vents near ridge -AHU located in attic

Ductwork Notes:

-All ductwork in attic is R-8 insulation and all flex duct except for plenum boxes off of AHU and transition boxes for some of the smaller supply branch lines (noted on drawings)

-Duct leakage is meeting 2015 code at 2.9% total leakage and 2.0% leakage to the outdoors, but boots/return box are not sealed to the sheetrock

Blower Door Test Result: -1,949 CFM@50Pa = approximately 6.13 ACH@50Pa

Bathroom Ventilation Rates: Downstairs half bath - 35 CFM Upstairs hallway full bath - 28 CFM Master bath - 22 CFM Master toilet - 28 CFM

Ster 757.963.1443 info@ocovativeenergy.com

N1103.2.2.1 Testing option. Duct tightness shall be verified by either of the following:

- Post-construction test: Leakage to outdoors shall be less than or equal to 8 cfm (3.78 L/s) per 100 square feet (9.29 m²) of conditioned floor area or a total leakage less than or equal to 12 cfm (5.66 L/s) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the entire system, including the manufacturer's air handler end closure. All register boots shall be taped or otherwise sealed during the test.
- 2. Rough-in test: Total leakage shall be less than or equal to 6 cfm (2.83 L/s) per 100 square feet (9.29 m²) of conditioned floor area when tested at a pressure differential of 0.1 inch w.g. (25 Pa) across the roughed in system, including the manufacturer's air handler enclosure. All register boots shall be taped or otherwise sealed during the test. If the air handler is not installed at the time of the test, total leakage shall be less than or equal to 4 cfm (1.89 L/s) per 100 square feet (9.29 m²) of conditioned floor area.

Exception: Duct tightness test is not required if the air handler and all ducts are located within conditioned space.

When this option is chosen, testing shall be performed by approved qualified individuals, testing agencies or contractors. Testing and results shall be as prescribed in Section N1103.2.2 and approved recognized industry standards.

N1103.2.2.2 Visual inspection option. In addition to the inspection of ducts otherwise required by this code, when the air handler and all ducts are not within conditioned space and this option is chosen to verify duct tightness, duct tightness shall be considered acceptable when the requirements of Section N1103.2.2 are field verified.

N1103.2.3 Building cavities. Building framing cavities shall not be used as supply ducts.

N1103.3 Mechanical system piping insulation. Mechanical system piping capable of carrying fluids above 105°F (40°C) or below 55°F (13°C) shall be insulated to a minimum of R-3.

N1103.4 Circulating hot water systems. All circulating service hot water piping shall be insulated to at least R-2. Circulating hot water systems shall include an automatic or *readily*

accessible manual switch that can turn off the hot water circulating pump when the system is not in use.

N1103.5 Mechanical ventilation. Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating.

N1103.6 Equipment sizing. Heating and cooling equipment shall be sized as specified in Section M1401.3.

N1103.7 Snow melt system controls. Snow- and ice-melting systems supplied through energy service to the building shall include automatic controls capable of shutting off the system when the pavement temperature is above 50° F (10° C) and no precipitation is falling and an automatic or manual control that will allow shutoff when the outdoor temperature is above 40° F (5° C).

N1103.8 Pools. Pools shall be provided with energy conserving measures in accordance with Sections N1103.8.1 through N1103.8.3.

N1103.8.1 Pool heaters. All pool heaters shall be equipped with a *readily accessible* on-off switch to allow shutting off the heater without adjusting the thermostat setting. Pool heaters fired by natural gas or LPG shall not have continuously burning pilot lights.

N1103.8.2 Time switches. Time switches that can automatically turn off and on heaters and pumps according to a preset schedule shall be installed on swimming pool heaters and pumps.

Exceptions:

- Where public health standards require 24-hour pump operation.
- Where pumps are required to operate solar- and waste-heat-recovery pool heating systems.

N1103.8.3 Pool covers. Heated pools shall be equipped with a vapor retardant pool cover on or at the water surface. Pools heated to more than 90°F (32°C) shall have a pool cover with a minimum insulation value of R-12.

SECTION N1104 LIGHTING SYSTEMS

N1104.1 Lighting equipment. A minimum of 50 percent of the lamps in permanently installed lighting fixtures shall be *high-efficacy lamps*.

Teb 757.277.0107 Info@ecovaliveenergy.com

ID:4828461

Far 757.963.1443

N1102.4 Air leakage.

N1102.4.1 Building thermal envelope. The *building thermal envelope* shall be durably sealed to limit infiltration. The sealing methods between dissimilar materials shall allow for differential expansion and contraction. The following shall be caulked, gasketed, weatherstripped or otherwise sealed with an air barrier material, suitable film or solid material.

- 1. All joints, seams and penetrations.
- 2. Site-built windows, doors and skylights.
- Openings between window and door assemblies and their respective jambs and framing.
- 4. Utility penetrations.
- Dropped ceilings or chases adjacent to the thermal envelope.
- Knee walls.
- Walls and ceilings separating the garage from conditioned spaces.
- 8. Behind tubs and showers on exterior walls.
- 9. Common walls between dwelling units.
- 10. Attic access openings.
- 11. Rim joists junction.
- 12. Other sources of infiltration.

N1102.4.2 Air sealing and insulation. Building envelope air tightness and insulation installation shall be demonstrated to comply with one of the following options given by Section N1102.4.2.1 or N1102.4.2.2.

N1102.4.2.1 Testing option. Tested air leakage is less than 7 ACH when tested with a blower door at a pressure of 50 pascals (0.007 psi). Testing shall occur after rough in and after installation of penetrations of the building envelope, including penetrations for utilities, plumbing, electrical, ventilation and combustion appliances.

During testing:

- Exterior windows and doors, fireplace and stove doors shall be closed, but not sealed;
- Dampers shall be closed, but not sealed; including exhaust, intake, makeup air, back draft, and flue dampers;
- 3. Interior doors shall be open;
- Exterior openings for continuous ventilation systems and heat recovery ventilators shall be closed and sealed;
- 5. Heating and cooling system(s) shall be turned off;
- 6. HVAC ducts shall not be sealed; and
- 7. Supply and return registers shall not be sealed.

N1102.4.2.2 Visual inspection option. The items listed in Table N1102.4.2, applicable to the method of construction, are field verified. Where required by the code official, an *approved* party independent from the installer of the insulation, shall inspect the air barrier and insulation.

N1102.4.3 Fireplaces. New wood-burning fireplaces shall have gasketed doors and outdoor combustion air.

N1102.4.4 Fenestration air leakage. Windows, skylights and sliding glass doors shall have an air infiltration rate of no more than 0.3 cubic foot per minute per square foot [1.5(L/s)/m²], and swinging doors no more than 0.5 cubic foot per minute per square foot [2.5(L/s)/m²], when tested according to NFRC 400 or AAMA/WDMA/CSA 101/I.S.2/ A440 by an accredited, independent laboratory, and listed and *labeled* by the manufacturer.

Exception: Site-built windows, skylights and doors.

N1102.4.5 Recessed lighting. Recessed luminaires installed in the *building thermal envelope* shall be sealed to limit air leakage between conditioned and unconditioned spaces. All recessed luminaires shall be IC-rated and *labeled* as meeting ASTM E 283 when tested at 1.57 psf (75 Pa) pressure differential with no more than 2.0 cfm (0.944 L/s) of air movement from the *conditioned space* to the ceiling cavity. All recessed luminaires shall be sealed with a gasket or caulk between the housing and the interior wall or ceiling covering.

SECTION N1103 SYSTEMS

N1103.1 Controls. At least one thermostat shall be installed for each separate heating and cooling system.

N1103.1.1 Programmable thermostat. Where the primary heating system is a forced air furnace, at least one thermostat per *dwelling unit* shall be capable of controlling the heating and cooling system on a daily schedule to maintain different temperature set points at different times of the day. This thermostat shall include the capability to set back or temporarily operate the system to maintain zone temperatures down to 55°F (13°C) or up to 85°F (29°C). The thermostat shall initially be programmed with a heating temperature set point no higher than 70°F (21°C) and a cooling temperature set point no lower than 78°F (26°C).

N1.103.1.2 Heat pump supplementary heat. Heat pumps having supplementary electric-resistance heat shall have controls that, except during defrost, prevent supplemental heat operation when the heat pump compressor can meet the heating load.

N1103.2 Ducts.

N1103.2.1 Insulation. Supply ducts in attics shall be insulated to a minimum of R-8. All other ducts shall be insulated to a minimum of R-6.

Exception: Ducts or portions thereof located completely inside the *building thermal envelope*.

N1103.2.2 Sealing. All ducts, air handlers, filter boxes and building cavities used as ducts shall be sealed. Joints and seams shall comply with Section M1601.4.1 of the *International Residential Code*. Verification of compliance with this section shall be in accordance with either Section N1103.2.2.1 or Section N1103.2.2.2.

Building Envelope Analysis

The blower door test had an air leakage result of approximately 6.13 ACH@50Pa (1,949 CFM@50Pa). Current new construction building code requires an air leakage rate of 5.0 ACH@50pa or less (1,588 CFM@50 for this home). While this home was not required to follow these standards when it was originally constructed, it indicates that the building envelope has more air leakage compared to others of the same size that are following these standards. Air leakage was found around unsealed plumbing and electrical penetrations in the sheetrock at ceilings and exterior walls, as well as various wall/floor transitions on exterior walls. There are several recessed can lights which are not sealed to the sheetrock throughout the home.

The fundamental principles of air infiltration are due to an event known as the "stack effect" which can have a significant impact on heat loss in the winter or heat gain in the summer. In this case, warm humid outside air can infiltrate into the home bringing in additional moisture as the air conditioning causes the cooler air to sink to the lower areas of the home where it escapes to the outside.

There was discoloration found around some of the supply grills throughout the home. Supply boots (and the return box) were not sealed to the sheetrock. The gap between supply boots and sheetrock are a source of duct leakage as well as air leakage through the building envelope. If certain sections of the home are under negative pressure, air leakage from the interstitial spaces between floors or from the unconditioned attic can infiltrate through the gaps around the supply boots, causing particulates to form the discoloration that was discovered around the supply boots.

The blown-in fiberglass insulation in the attic is not in full contact with the ceiling sheetrock in several areas, most notably underneath large sections of the ductwork. This can cause warm air to enter the space between the ceiling sheetrock and ductwork where they may become condensing surfaces if either the sheetrock or ductwork reach below the dew point. The attic insulation should be in full contact with the sheetrock across the entire ceiling plane.

www.ecovativeenergy.com

Crawlspace Analysis

The home is built on a vented crawlspace. There is a vapor barrier on the ground, but it is not sealed at seams, penetrations or around the perimeter where it meets the foundation walls or inner structural piers. Additional moisture in the ground can move through the openings in the vapor barrier where it can eventually migrate into the home, causing increased levels of humidity.

The insulation in the floor joists are paper-faced fiberglass batts. There was a consistent layer of mold found on the paper-face of all the insulation that was inspected as well as the underside of the subfloor which is in contact with the paper-face side of the insulation. The finished floor is VCT tiling in all rooms of the first floor, which may have low permeable layers that are slowing down the moisture transmission through the floor assembly. This may be causing the moisture to become trapped between the insulation and the sub-floor, causing the mold growth that was observed.

Exterior Grading Analysis

The home has several areas with neutral grading and some areas at a slight negative slope back towards the home. There are no gutters/downspouts to control bulk water management and no evidence of a curtain drainage system around the perimeter foundation walls. Without a bulk water management system coupled with ineffective exterior grading, water can pool around the perimeter foundation walls where it can migrate into the crawlspace through capillary action and eventually into the home.

Additional HVAC Analysis

The thermostat was set to 67°F when entering the home. Relative humidity increases as sensible temperatures decrease. Therefore, the colder the home is set to, the higher the relative humidity will be. This also brings vulnerable surfaces such as the ceiling under the attic closer to dew point temperatures where mold can potentially form.

The condensate line also discharges directly onto the perimeter foundation wall behind the outdoor condenser unit. The moisture which is being removed by the HVAC system then re-enters the home through capillary action into the crawlspace where it can migrate back into the home.

Re: State Building Code Technical Review Board "Appeal to the Review Board for Anthony Grant (Appeal No. 21-03)"

The City of Suffolk retained Ecovative Energy to perform an analysis of the "as-built" conditions of the single family dwelling located at 4281 Cole Avenue, Suffolk VA, 23435, for purposes of the Suffolk Local Board of Building Code Appeal's better reevaluation of the adequacy of the HVAC system. Carl Stevens of Trademark Mechanical provided HVAC load calculations, based off of the on-site evaluation data provided by Ecovative Energy, for confirmation purposes of adequate heating/cooling loads and equipment sizing. Accurate evaluation of the duct system would require destructive exploration removing interior gypsum ceilings to expose and map duct material, sizes, plenums, and their connections. Based on the available information, the Local Board of Building Code upheld the previous decision by vote and signed Resolution 01-2020.

4/23/2021

Michael Robinson, CBO Building Official

August 31, 2020 4281 Cole Ave, Suffolk VA Client: City of Suffolk

Exterior Notes:

-Siding is light beige vinyl with white trim
-Medium color brick veneer over crawlspace foundation walls
-Medium color asphalt shingles
-Front of home is facing N/NW
-Shading from trees on SW side of home
First Floor Notes:
-Thermostat centrally located at bottom of stairs. One system, one zone
-No return duct on first floor
-Flooring is all VCT on entire first floor
-Sits on top of vented crawlspace with vapor barrier
-Floor joist insulation is paper-faced fiberglass batt (5.5" thick - R-value lettering not visible due to mold and moisture stains on paper face of insulation batts)
-Foundation walls are 2' high from grade to bottom of framing
-Floor joists are 2x8 @16" OC
-Insulation on exterior walls confirmed as fiberglass batts, but thickness and face vs. un-

faced is unknown

Second Floor Notes:

-All flooring is carpet except for Master bathroom which is tile

-Floor joists are 2x8 @ 16" OC

-Master BR has different ceiling height and drop soffit where only supply grill is located -Insulation of floor joists for room over garage confirmed, but thickness unknown -Insulation on exterior walls confirmed as fiberglass batts, but thickness and face vs. unfaced is unknown

Window Notes:

-All windows are double pane with no Low-E coating

-Bottom half have bug screens on outside of pane

-All windows have 45 deg. angle blinds (except windows noted on drawings without)

-All windows are vinyl frame and sash

-Front entry door only exterior door with glazing (noted on drawings)

Attic Notes:

-Ceiling joists are 2x8 @ 16" OC

-Insulation is blown in loose-fill fiberglass @ 14-15" high (7-8" continuous R-value over studs)

-Attic pulldown stairs has R-5 foam board on door panel

-Attic is vented with soffits and static vents near ridge

-AHU located in attic

Ductwork Notes:

-All ductwork in attic is R-8 insulation and all flex duct except for plenum boxes off of AHU and transition boxes for some of the smaller supply branch lines (noted on drawings)

-Duct leakage is meeting 2015 code at 2.9% total leakage and 2.0% leakage to the outdoors, but boots/return box are not sealed to the sheetrock

Blower Door Test Result: -1,949 CFM@50Pa = approximately 6.13 ACH@50Pa

Bathroom Ventilation Rates: Downstairs half bath - 35 CFM Upstairs hallway full bath - 28 CFM Master bath - 22 CFM Master toilet - 28 CFM

All testing performed by Ecovative Energy is completed by Certified Third Party testing specialists who follow the ANSI/RESNET/ ICC 380-2016 Standard for Testing Airtightness of Building Enclosures, Airtightness of Heating and Cooling Air Distribution Systems, and Airflow of Mechanical Ventilation Systems.

The plan review process can be a complex and lengthy proc	edure. However, a well researched, properly prepared set of plans submi	tted with sufficient details sections and information processes to

determine compliance with the Commonwealth of Virginia codes and County or local ordinances will move quickly through the process and have fewer reasons for rejection. The approved detailed plans are required on a job site during the inspection process to help reduce delays and the number of re-inspections.

To aid design professionals and contractors, the following list has been prepared as a guide only. Depending on the scope of work to be permitted, some items may not apply, or more specific information may be required. Using this form should greatly reduce the chances of submitting deficient plans. Plans found with insufficient information will be rejected, requiring revised plans to be resubmitted when all corrections are made. Sheets in plans should have all items that pertain to the headings in solid black background. Recommended sequencing of plans should be same order as black headings. The following items must be included with all residential permit applications at the time of submittal. The application will not be reviewed if all items have not been included.

Please see local jurisdiction cover sheet for any extra submittal guidelines.

With your response to our remarks, identify where your response is located on the plans. Partial responses will not be accepted. The corrections noted here are subject to change and/or be added to for code compliance as updates are made to plans.

Instructions

For BLOCK LOADS:Use supporting data from Worksheets A-H (on pages 3, 6, 7, and 8) to complete Form J1AE (on page 2).For ROOM-BY-ROOM
LOADS:Form J1AE (page 2) mates at the arrows with page 4 (Room Calculation Worksheet). The individual room
loads are "tallied" into Block Load/Room Summation column (page 2).
Use supporting data from Worksheets A- H (on pages 3, 6, 7, and 8) to complete Form J1AE (on page 2).

Note: Worksheet F is not part of the Abridged Edition methodology and is not included in Form J1AE.

Table 3A

MJ8_{AE} Procedure: Default Cooling HTM for Generic Windows and Glass Doors No External Sun Screen, Clear Glass

Cooling Load (Btuh) = HTM × Reference Area Bay Window HTM = $1.15 \times \text{Table HTM}$ Garden Window HTM = $2.00 \times \text{Table HTM}$ French Door HTM = $0.70 \times \text{Table HTM}$ Use Single Pane, Clear Glass for Jalousie Window

Default indoor design temperature = 75°F. Outdoor design temperature provided by Table 1. Load area appears above HTM values. Table 3, note 2 (after-Table 3E-5) specifies the order of application of the HTM adjustment procedures.

Recommended Adjustments

- 1) Full outdoor insect screen = 0.80 × Table HTM
- Half outdoor insect screen = 0.90 × Table HTM
- Full indoor insect screen = 0.90 × Table HTM
- Half indoor insect screen = 0.95 × Table HTM
- 2) Shade by external overhang (See Table 3E-1)

No Optional Adjustments

- 1) See Table 3E-3 for foreground reflectance adjustment.
- 2) 40° North latitude, see Table 3E-2 for latitude adjustment.
- 3) Medium color blind, drape or roller shade. See Table 3E-4 for
- -light or dark color adjustment.

Table 4A

Heating and Cooling Performance for Opaque Panels **U-Values and Group Numbers or CLTD Values**

Heating Application

Heating Load HTM = U-Value x (Indoor Design Temperature – Outdoor Design Temperature)

Heating Load (Btuh) = HTM x Reference Area

Default indoor design temperature = 70°F Outdoor design temperature provided by Table 1. Reference area provided with construction number.

Heating Exceptions

- Number 15 Basement walls may be partly above grade and partly below grade: Below Grade Heating HTM = Below Grade U-Value x HTD; Heating Load = HTM x Below Grade Wall Area Above Grade Heating HTM = Above Grade U-Value x HTD; Heating Load = HTM x Net Above Grade Wall Area Above Grade Cooling HTM = Above Grade U-Value x CLTD; Cooling Load = HTM x Net Above Grade Wall Area Above Grade Cooling HTM = Above Grade U-Value x HTD; Heating Load = HTM x Net Above Grade Wall Area Above Grade Cooling HTM = Above Grade U-Value x CLTD; Cooling Load = HTM x Net Above Grade Wall Area Number 19 Passive or radiant floor over enclosed craw space: HTM = U-Value x Floor TD From Table 19 Number 20 Radiant floor over open crawlspace: HTM = U-Value x (HTD + 25) Number 22 Passive slab floor: HTM = F-Value x HTD; Heating Load = HTM x Running Feet of Exposed Edge Number 22 Radiant slab floor: HTM = F-Value x (HTD + 25); Heating Load = HTM x Running Feet of Exposed Edge Table 4C Partition wall for closed garage Table 4D Partition wall for closed suproom

- Partition wall for closed sunroom Table 4D -
- Table 4E Ceiling below an encapsulated attic

Cooling Application

Cooling HTM = U-Value x Table 4B CLTD Value

Cooling Load (Btuh) = HTM x Reference Area

Default indoor design temperature = 75°F.

Outdoor design temperature and daily range provided by Table 1. Design Temperature Difference = Outdoor Design Temperature – Indoor Design Temperature Use the CLTD provided by Table 4A or use the Table 4A group number and the Table 4B CLTD. Reference area provided with construction number.

Cooling Exceptions

Table 3E

Heat Gain Adjustment for Generic and NFRC Rated Fenestration

HTM-Adjustments for Overhang, Foreground Reflectance, Latitude and Internal Shade Color

Table 3E-1 adjustment procedures for shade by an overhang and foreground reflectance apply to generic, rated, and MISAE windows and glass doors. The Table 3E-2 foreground reflectance adjustment applies to generic and rated windows and glass doors. The HTM adjustment procedures for latitude and internal shade color only apply to generic fenestration (the HTM equation for rated fenestration is sensitive to latitude and shade color). Table 3E-3 3E-5 estimates the shading coefficient for an unrated or undocumented sun screen. Table 3, note 2 (follows Table 3E-5) specifies the order of application of the HTM adjustment procedures.
